The acceptance or reject of GMO (Genetically Modified Organisms) is a controversial issue in the European Community, with an opposition of divergent scientific arguments generally linked to different opinions (Berlan & Lewontin 1986, Kempf 2003, Bonneuil *et al*. 2008). These opinions are often rooted in philosophical points of view on Nature and on Environment, associated with divergent values (Schultz & Zelezny 1999, Clément 2004a, 2004b). In a broader way, the importance of values in science education is re-emerging (Corringan, Dillon & Gunstone 2007), and values are not exactly the same among the European countries (Galland & Lemel 2007). According to European Commission public opinion survey (Eurobarometer, 2008), the majority of Europeans are opposed to the use of GMOs (58%). At the country level the resistance is more important in some countries as Cyprus (82%) than in other ones as Malta (28%) or Portugal (28%).

What are the teachers' conceptions related to GMO in different European countries? Are their conceptions linked to their philosophy and attitudes on Nature and Environment? Are they linked to their scientific knowledge, or mainly to their values? Are there differences among countries, or among other teachers' characteristics (as their age, gender, level of instruction)?

METHODS

Twelve European countries were chosen from their diversity, from North to South and East to West of Europe, from diverse economical levels and cultures, including differences among their religions: Cyprus, Estonia, Finland, France, Germany, Hungary, Italy, Lithuania, Malta, Poland, Portugal, Romania. In each country, six samples of about 50 teachers filled out a questionnaire: in-service teachers in primary schools (InP), in-service teachers in secondary schools teaching biology (InB) or language (InL); pre-service teachers for primary schools (PreP), pre-service teachers for secondary schools in biology (PreB) or language / letters (PreL); for a total of 4248 teachers in the 12 countries.

Each teacher filled out a questionnaire built by a collective work of the European research project Biohead-Citizen (Biology, Health and Environmental Education for better Citizenship, 2004-2008). Our theoretical basis and our methodology are described in other works (Caravita *et al*., 2008; Clément & Carvalho, 2007). We used several precautions: a pilot test, interviews, avoiding bias in translation, etc. The final questionnaire (144 questions) included 29 questions related to Environment, 5 of them dealing with GMO. The teachers' answers were discussed using multivariate analyses (Munoz *et al*., 2009): mainly PCA and between analyses completed by randomization tests (Monte Carlo type).

RESULTS

* The PCA (Principal Components Analysis) shows the main oppositions among the 4248 teachers' conceptions: the first one between the poles preservation and utilization of environment, with some link between preservation and anti-GMO opinions, and between

utilization and pro-GMO opinions. The second opposition is related to the "feelings" of animals: being ecolocentric (pole preservation) or anthropocentric (pole utilization), a teacher can think that snails, flies and frogs are or not able to feel happiness. The third principal component is mainly defined by the 5 questions related to GMO, with a clear opposition between the pole anti-GMO and the pole pro-GMO.

* A between analyses shows that the teachers' conceptions differ very significantly ($p < 0.001$) among the 12 European countries, mainly from the questions related to preservation or utilization of Environment. For instance, more than 80% of teachers are, in Lithuania, confident with the society to solve even the biggest environmental problems, while this percentage is about 1/3 in Finland and Poland, but less than 10% in the other countries.

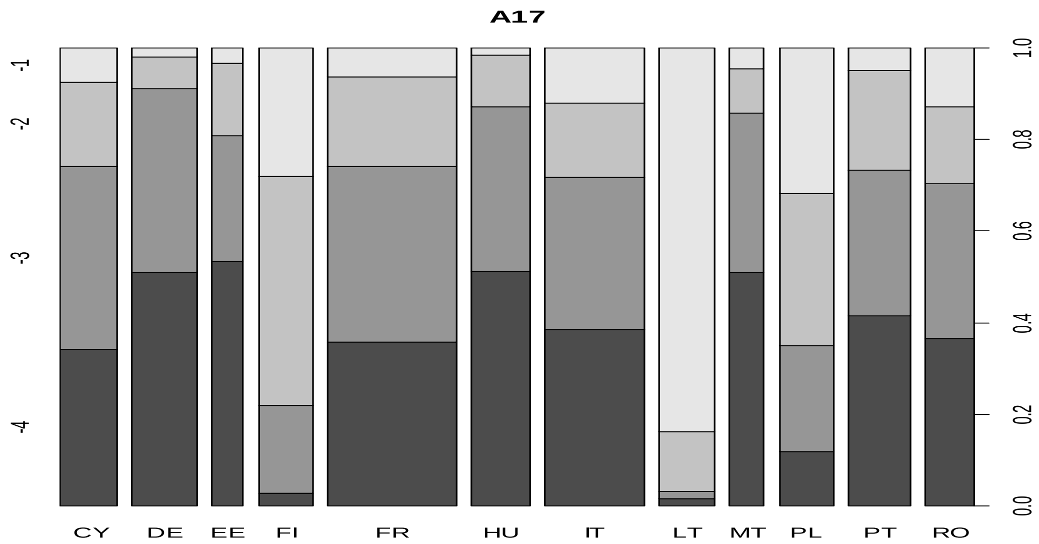

Figure 1 - Answers of teachers to the question A17 ("Society will continue to solve even the biggest environmental problems"), from “I don't agree” (-4 dark) to “I agree” (-1 light), grouped by country by alphabetic order: CY = Cyprus, DE = Germany, EE = Estonia, FI = Finland, FR = France, HU = Hungary, IT = Italy, LT = Lithuania, MT = Malta, PL = Poland, PT = Portugal, RO = Romania.

* An other between analysis shows that biology teachers (InB and PreB) have more scientific knowledge on GMO than their colleagues, and are also more pro-GMO.

* An other between analysis shows a significant gender effect, men being a little more pro-GMO than their female colleagues.

* We also found a significant effect of the teachers' level of qualification: more a teacher studied in University more he or she disagrees with the proposition "Our planet has unlimited natural resources".

CONCLUSIONS

The controversial issue of GMO is only partly linked to other conceptions on Environment, and has some specificity. The differences among the countries are mainly related to teachers' values, their philosophy of Nature, utilization or preservation of Environment. The opposition between pro- and anti-GMO are found inside each country, with some significant correlations with the teachers' gender, their level of qualification, and the difference between the biology teachers and their colleagues. Finally, the teachers' opinions on GMO are less linked to their knowledge on the possible danger of GMO for environment than to a reject of too much biotechnology, as already suggested by de Chevigné (2004).

FINDING A SUSTAINABLE CULTURAL IDENTITY AS A SCIENCE TEACHER EDUCATOR: A MOZAMBICAN PERSPECTIVE

Alberto Cupane
University Pedagogica Maputo
acupane@hotmail.com

Peter Charles Taylor
Curtin University of Technology
p.taylor@curtin.edu.au

ABSTRACT

Mozambican schools are not helping students to see themselves as culturally rich beings because local cultural values, traditions, knowledge and beliefs have never been included in the curriculum. More than 30 years after independence from 500 years of Portuguese colonial rule, Mozambican science teachers continue to serve as agents of assimilation of students into a Western modern worldview that is indifferent to their local cultural identities and aspirations. As a science teacher educator preparing new teachers for Mozambican schools Cupane (first author) saw his cultural identity to be part of the problem and part of the solution. He designed a critical auto-ethnographic inquiry and explored (and transformed) his cultural identity as he addressed the key research question: *How can school science serve better the cultural development of local school communities in Mozambique?* A key outcome of this research is Cupane's multi-cultural identity as a Mozambican, an indigenous (Changana) person, a world citizen, and a science teacher educator. Generating this understanding has fuelled his vision of future science education for Mozambique for which he has articulated a culture-sensitive philosophy of physics teacher education.

Keywords: *culture, identity, indigenity, non|essentialism, critical auto-ethnography*

INTRODUCTION

Indigenisation of the science curriculum has become a worldwide issue for Western nations with substantial indigenous populations such as Canada and South Africa. In Australia the new national primary science curriculum is currently being 'indigenised', but there is no shortage of debate about how best to accomplish this controversial task. On the one hand, mainstream scientists are questioning the academic status of indigenous knowledge. On the other hand, critical science educators are complaining about indigenous culture being assimilated into the dominant Western modern worldview. In Mozambique local cultural values, traditions, knowledge and beliefs have never been included in the curriculum. As a science teacher educator preparing new teachers for Mozambican schools in the postcolonial era Cupane (first author) saw his cultural identity to be part of the problem and part of the solution. He designed a critical auto-ethnographic inquiry, involving narrative and autobiographical research methods, socio-cultural theories and dialectical thinking, and explored his cultural identity as he addressed the key research question: *How can school science serve better the cultural development of local school communities in Mozambique?* (Cupane, 2007).

THEORETICAL PERSPECTIVE

Under Portuguese colonial rule school curricula in Mozambique were based on an 'essentialist' view of culture (Ashcroft, Griffiths, & Tiffin, 2000) in which indigeneity is non-existent in modern life because interaction with the West destroyed the purity of the Indigenous people (Semali & Kincheloe, 1999). From this perspective, indigenous knowledge is understood as primitive, and although it is has become a focus of academic knowledge it is not yet widely regarded as legitimate academic knowledge that can be studied in the science classroom. And so Mozambican science classes continue to serve as sites of uncritical assimilation, or one-way border crossing, into the Western modern worldview, thereby robbing Mozambican children of the opportunity to develop a more complex, dynamic and sustainable cultural identity. In this study, a 'non|essentialist' perspective on culture as a dynamic process was adopted, where '|' signifies a dialectical relationship between nonessentialism (cultural instability) and essentialism (cultural stability). In this view, identity is characterised by the way that family, religion, political agency, education and human rights have significance for the individual as self, connected to human aspirations in a given space. This is moral identity and is shaped by family, neighbourhood, the city and the ethnic group. Sfard and Prusak (2005) suggest that identities can be known by stories told by individuals. Identity results from everyday interactions and decisions taken in everyday life. This notion of identity can help to unravel how the processes of academic failure and success occur in school science, especially in a postcolonial context.

METHODOLOGY

For science education, critical auto-ethnography is an innovative research method that draws on multiple research paradigms to engage the researcher in a process of transformative professional development (Ellis & Bochner, 2000; Taylor, Settelmaier & Luitel, in press). In this study, the first author undertook prolonged critical reflexive inquiry into his cultural identity by: excavating his cultural memory using a range of logics (metaphor, dialectics, poetics), representing this experiential data via numerous genres (story, narrative, poetry), subjecting it to critical theoretical scrutiny (or decolonisation), and engaging in creative reconstruction via a process of philosophical envisioning. The second author served as his 'critical friend'. A range of rigorous quality standards (alternatives to validity, reliability, objectivity) were used to regulate the generation of the researcher's personal practical self-knowledge. They will be explained in the paper.

OUTCOMES

For me (Cupane), one of the major outcomes of this research was coming to know 'who I am', both as a Mozambican and as a professional science educator. An important realisation is how incomplete is the cultural identity given by my ID card. The physical environment, my cultural capital, the weather, and my students are all stimuli that elicit different aspects of me, but my ID card states that I am a science teacher educator without feelings. I have come to believe that my full professional identity can parade in the science classroom only when these stimuli are in a sustainable relationship. This transformed self-understanding helps me to be at peace with myself as: a Mozambican, an indigenous (Changana) person, a world citizen, and a science teacher educator. This understanding has fuelled my vision of future science education for Mozambique, given that we are living not only in a free market period but also within previous times and that this entanglement is dangerously invisible to us. Our school science curricula continue to serve only the modern Western worldview, ignoring the urgent realities of both the traditional and rapidly emerging 'post|modern' worldviews of contemporary Mozambican society. By making clear in my own professional practice how I have achieved my personal sustainability, a clear sense of who I am, my colleagues and students (pre-service physical science teachers) can benefit as they are facing similar problems of cultural identity and curriculum adaptation. The paper will explain this outcome in detail, especially my emergent philosophy of a culture-sensitive physics teacher education for Mozambique.

THINKING ABOUT SCIENCE – THE IMPORTANCE OF INTUITIVE IDEAS FOR MEANINGFUL LEARNING

Arne Dittmer **Ulrich Gebhard** **Rosemarie Mielke** **Kerstin Oschatz**

Didactics of Biology & Educational Psychology, University of Hamburg, Germany

ABSTRACT

This paper describes the didactic concept and research program "Intuition & Reflection" (Gebhard 1994, Gebhard & Mielke 2001), its theoretical fundamentals as well as empirical data and the implications of this research for students, pre-service teacher trainees and science teachers. Within the theoretical approach presented here the relevance of reflecting the intuitive mind to promote critical thinking among biology students and pre-service teacher trainees is investigated. While dealing with topics like gene technology intuitive ideas concerning perspectives on mankind and the world get activated. Dual-process models of information processing, give an insight into the importance of internalized convictions and beliefs, for dealing with new information. Internalized ideas are highly important for the emergence of intuitive appraisals as well as the interest and the behaviour that individuals display while dealing with a topic. Reflecting on intuitive ideas linked to gene technology during learning of genetics was shown to have positive effects on learning within field studies. In an experimental study these effects have been further examined.

CULTURALLY ROOTED INTUITIVE IDEAS ABOUT MANKIND AND THE WORLD

There is a growing awareness that reflecting on the nature of science and ethical aspects of sciences should be an integral part of science education. The biosciences influence our daily lives and the visions of biomedicine, gene technology or socio-biology alter our perspectives on mankind and the world. They touch on central questions of how we want to life, what we can know or what it means to be human. Such topics automatically stimulate intuitive ideas about the holiness of live or the idea that natural things are intrinsically good. Such ideas are grounded in cultural knowledge and learned during socialisation mostly in an implicit way. One central concern of the didactic approach and research program "Intuition & Reflection" is the question, how science education can promote the development of scientifically literate citizens. Traditional educational approaches just focus on reflective thinking and ignore the importance of nonreflected implicit beliefs. Reflective thinking is just one way to process information about the world and is considered an expensive cognitive way of decision making.

DUAL-PROCESS MODELS AND THE SOCIAL INTUITIONIST MODEL OF MORAL JUDGEMENT

Dual-process models of information processing permit a better understanding of the meaning of internalized convictions for the evaluations, the interest and the behaviour that individuals display when dealing with a subject. According to these models information can be processed reflectively or automatically (Chaiken & Trope 1999). Consciously reflected behaviour requires heightened attention capacities and is therefore the exception rather than the rule in everyday life. Most information is processed uncontrolled through an automatic activation of ideas. How closely subject area matters and other associations are connected in a person’s memory, determines how fast they come to one's mind spontaneously. Dual-process models therefore allow for a more in depth understanding of the importance of internalized convictions for the emergence of intuitive appraisals of a matter as well as the interests and behaviour that ensue (Strack & Deutsch 2004). From a psychological perspective the brain is a connectionist system that tunes up slowly, but is then able to evaluate complex situations quickly. According to this psychological explanation of the role of intuitive thinking, Haidt (2001) postulates his *Social Intuitionist Approach* to moral judgment. In this model it is claimed that evaluating intuitions come first and directly cause moral judgments. The social part of the Social Intuitionist model proposes that judgments are influenced by cultural rooted values and social interactions. According to this model reasoning may occur objectively just under very limited circumstances: when the person has enough time and processing capacity and the motivation to be accurate. The Social Intuitionist approach is also relevant in respect to the hidden ideas about science and nature. As implicit knowledge these ideas influence our thinking about the ethical aspects of biosciences.

EMPIRICAL DATA

Reflecting on intuitive ideas linked to gene technology during the learning of genetics, had positive effects on learning, within field studies. Within an interventional study, it was shown that the integration of student’s intuitive ideas on genetic engineering into their learning of the subject had a positive effect on their learning efficiency (Born 2008). Students of the interventional classes showed substantial progress in learning compared to students of control classes, especially in the follow up. In an experimental study these effects were further examined in respect to the underlying cognitive processes. Results reveal an immediate irritational effect of the reflection of intuitive ideas that indicates the importance of these automatically generated ideas. Participants of the treatment group scored lower on subsequent achievement tests than did control group participants. Especially learners with a high *need for cognition* (Cacioppo & Petty 1982) and sophisticated epistemic beliefs (Hofer 2001) were affected, using more cognitive capacity to process their intuitive ideas reflectively (Oschatz et al. 2009). Results of a second experimental study show the importance of social interactions for the fruitful reflection of intuitive ideas. After discussing their intuitive ideas with others, participants of the treatment group with a high *need for cognition* and sophisticated epistemic beliefs scored higher on subsequent achievement tests than participants of the control group with high *need for cognition* and sophisticated epistemic beliefs. Obviously the immediate effect of irritation turns into a beneficial cognitive stimulation, if learners are allowed to exchange their ideas with others and have more time to process their intuitive ideas. Social settings and social interactions matter because they encourage the development of reasoning. The Social Intuitionist model proposes an arrangement that fully integrates reasoning, emotion, intuition, and social influence.

PHILOSOPHIZING IN SCIENCE CLASSES AND THE OPEN-MINDED TEACHER

The relevance of this didactic approach and research programme can be discussed in three ways: First there is a need for open minded science teachers, who are informed about the cultural roots of beliefs and values. During their science studies pre-service teacher trainees have to think about their profession in a broader and deeper manner. Second there is a need for learning styles in science classes which promote critical thinking and philosophizing about the relation between science and culture. Philosophical enquiry is an activity to reconstruct intuitive ideas about science. The method “Philosophy for Children“ (Lipman 1991) for example is an activity of philosophical questioning and concept-analyses connected with an attitude of open-mindedness and dialogue oriented communication. These techniques and attitudes seem to be necessary conditions for becoming a scientific literate educator and citizen. The structure of many science lectures however does not have a form that requires a deeper understanding of science or to reflect internalised beliefs and values (Dittmer 2010). Third there is a need to develop a detailed understanding of the interactions between reflective and intuitive thinking in science education.

TEACHING THE GENETICS OF COMPLEX TRAITS

Michael J. Dougherty

Director of Education
The American Society of Human Genetics
9650 Rockville Pike
Bethesda, MD 20814 USA

mdougherty@ashg.org

ABSTRACT

The goals of primary and secondary science education are to help prepare scientifically literate citizens and future scientists. Scientific literacy is perhaps most personally meaningful and necessary in genetics and medicine. Rapid changes in human genetics, in particular recent insights into the genetics of complex traits, may revolutionize healthcare. However, citizens are ill-prepared for this transformation. One potential solution is to modernize the genetics curriculum so that it matches the science of the 21st-century. This paper outlines the problems with current genetics instruction, highlights changes in human genetics that support a curricular reorganization, and proposes a new genetics curriculum.

Keywords: *Genetics; complex traits; scientific literacy; curriculum; medicine*

INTRODUCTION

In spite of efforts to improve science education, students in the United States continue to lag behind their peers in other countries (PISA 2006). This underperformance is true for genetics, and for science and math in general, and is particularly worrisome given the accelerating need for scientists and engineers in an increasingly technology-driven economy (Table 1, O'Sullivan, 2003). Unfortunately, even students in high-performing European countries, such as Finland and Slovenia, have relatively small percentages of students performing at the higher levels of proficiency (PISA, 2006).

TABLE 1

NAEP test results in 2000 for science reveal a deficit in student understanding of core genetics concepts (O'Sullivan *et al*. 2003)

Theme	Grade	Students with complete/essential answers (%)	Students with partial answer (%)	Students with unsatisfactory answer (%)
Classification	8	23	16	58
Theory of evolution	8	53	NA	45
Reproduction	12	61	NA	39
Evolutionary relationships	12	25	NA	70
Darwin's theory of evolution	12	51	NA	47
Genes*	12	21	45	30
Mutation*	12	2	33	58
Interpreting genetic material*	12	1	1	83
Genetic disease*	12	5	31	56
Recombinant DNA usage*	12	8	27	58

Percentages may not total to 100 due to rounding and student omission (i.e., no answer was given).
*These questions are in the molecular and human genetics category.

METHODS

A comprehensive review of the genetics education, curriculum, and genomics literature was conducted to ascertain the status of current genetics instruction. Those results led to new hypotheses regarding how genetics concepts should be taught. Current work to develop new curricula to test those hypotheses is in progress as is research to determine the possible impact of U.S. education policy on genetics instruction.

RESULTS

The field of genetics research has changed rapidly as a result of the dramatically reduced costs of DNA sequencing. Researchers can now examine a person's entire genome for genetic contributions not only to single-gene, Mendelian disorders but to complex traits related to health and disease, such as height, weight, diabetes, and autism. Complex (or quantitative) traits are the result of many genes working together and with the environment. Understanding complex trait genetics is now critical for the preparation of the next generation of geneticists and health-care consumers.

Unfortunately, only 10-15% of state science standards in the U.S. specify that students should learn about complex trait genetics, which means that those concepts are rarely taught in middle and high school biology classes. Instead, genetics instruction remains focused almost exclusively on simple, single-gene traits. Undergraduate genetics also emphasizes simple inheritance at the expense of complexity (Hott, et al, 2002; Dougherty, 2009). Moreover, the sequence of topics taught in most genetics courses roughly follows the historical development of genetics research, which until recently focused (necessarily) on Mendelian inheritance of dominant and recessive traits. This outmoded sequence continues to be used in spite of evidence that it is ineffective and leads to a variety of common misconceptions about genetics (Shaw, et al, 2008).

CONCLUSIONS

These findings are problematic. With large increases in the number of genetic tests available, including direct-to-consumer genetic testing, our students need to understand how concepts such as inheritance and risk differ between complex and simple traits. Genetics also raises ethical, legal, and social issues that students and the public should understand. Geneticists have always been interested in complex traits, but the emphasis on single-gene traits was a natural consequence of the fact that those were the phenomena we could best apprehend, a situation that is still true. However, given what we know about the deficiencies in the current curriculum and student understanding, and armed with an improved understanding of the genetics of complex traits, there is no longer a compelling reason to maintain the historical sequence of our syllabus. Indeed, the direction of genetics research and medicine suggests that an alternative may be in order. Specifically, it may be preferable to “invert” the curriculum—that is, introduce common complex traits before rare, single-gene traits—to close the gap in student understanding (Dougherty, 2009).

ENVIRONMENTAL LITERACY of PRE-SERVICE SCIENCE AND MATHEMATICS TEACHERS IN TURKEY: EFFECT of GENDER AND ACADEMIC MAJOR

Betul Ekiz	Elif Selcan Kutucu	Huseyin Akkus
Yuzuncu Yil University	Yuzuncu Yil University	Gazi University
ebetul@metu.edu.tr	kselcan@metu.edu.tr	akkus@gazi.edu.tr

ABSTRACT

The purpose of this study is to investigate the relationship between gender and academic major of pre-service science and mathematics teachers and their environmental literacy. Environmental literacy questionnaire was used to collect data. The result of the study revealed that although there is no statistically significant difference between female and male pre-service teachers environmental literacy, mean scores of female pre-service teachers is greater than males in terms of their environmental attitude, concern and behavior. A significant difference was found among academic majors of pre-service teachers. Also environmental concern of pre-service teachers was correlated with their parents' interest to environmental problems.

Keywords: *Environmental literacy, pre-service teachers, gender, academic major*

INTRODUCTION

Great importance should be given to the environmental literacy in environmental education due to the increase in environmental problems. Environmental literacy includes four major components (Disinger&Roth, 1992) namely knowledge, attitude, concern and behavior and it is important to know pre-service teachers opinions of these constructs as environmental literacy influences teaching activities of a teacher in environmental education. Academic major and gender are crucial variables in investigating environmental literacy of individuals (Ozturk, 2009). Because of this, the primary purpose of this study is to investigate the effect of gender and academic majors of pre-service science and mathematics teachers on their environmental literacy. The secondary purpose is to investigate if there is a correlation between components of environmental literacy and parents' concern to the environmental problems.

METHOD

In this study, the survey data was statistically analyzed by using multivariate analysis of variance (MANOVA). The independent variables were academic major and gender of students. Environmental literacy questionnaire which is composed of four dimensions such as environmental knowledge, environmental attitudes, perception of environmental uses and environmental concerns were the dependent variables of our study. All analyses were conducted at the 0.05 level of significance. The knowledge component of questionnaire is composed of multiple choice items to assess pre-service teachers' knowledge about current environmental issues and it was developed by National Environmental Educational and

Training Foundation (NEEFT) and Roper. The other three components are regarding pre-service teachers' environmental attitudes, uses and concerns using five Likert-type scales. The instrument was originally developed in English and, translated and adapted into Turkish. The internal consistency of the knowledge, attitudes, uses, and concerns dimensions were found to be 0.88, 0.64, 0.80, 0.88, using Cronbach alpha respectively (Tuncer et al., 2009). In our study, the internal consistency of the knowledge, attitudes, uses, and concern components were found to be .44, .43, .70, .72. using Cronbach alpha respectively. This study was conducted with 167 pre-service teachers (124 female, 43 male) from chemistry (48 individuals), physics (48 individuals), biology (37 individuals) and mathematics (34 individuals) majors in secondary science and mathematics education department in a public university in Turkey during fall semester of 2009.

RESULTS AND CONCLUSION

The mean responses of environmental literacy components were compared by gender and academic majors of students. Firstly, the result of analysis testing gender differences indicated that female pre-service teachers have greater mean than their male counterparts in terms of all environmental literacy components except for environmental knowledge (see Table 1). This result is consistent with the previous research results (Tuncer et al., 2009). However, no statistically significant difference was found between female and male pre-service teachers in terms of environmental components.

Table1. Mean environmental literacy components by gender

	Males		Females	
	M	S.D	M	S.D
Knowledge	7.14	1.97	6.55	1.86
Attitude	3.43	0.65	3.50	0.37
Use	4.14	0.40	4.23	0.32
Concern	3.84	0.68	3.92	0.73

Secondly, the role of academic major on environmental literacy of pre-service teachers was investigated and the result indicated that there is a significant difference among pre-service teachers from different academic majors as consistent with other studies (Ozturk, 2009; Goldman, Yavetz & Pe'er, 2006). The analysis of environmental literacy components' means showed a significant difference in the mean score of pre-service teachers in terms of environmental attitude ($F= 3.984$, $p< .05$) items.(see Table 2)

Table2. Comparison of mean environmental literacy components with respect to academic majors

Major	F	p	η^2
Knowledge	1.037	0.378	0.019
Attitude	3.984	0.009	0.070
Use	1.038	0.378	0.019
Concern	1.494	0.218	0.027

Finally, the result of this study revealed that there is a medium positive correlation between the parents' concern about environmental problems and environmental concern of pre-service teachers (r =.281). However, no significant correlation was found between environmental concern of pre-service teachers' parents and their responses to the environmental behavior and knowledge components.

WHAT HINDER SCIENCE TEACHERS IN SECONDARY SCHOOL FROM CHANGING THEIR TEACHING PRACTICE IN WANTED DIRECTION?

ABSTRACT

Many Norwegian science teachers want to make changes in their teaching practice. They want the pupils to be more active, talk more about scientific topics and do more scientific activities. However, it seems to be difficult for the teachers to change their teaching practice in that direction. Some explanations of why they want more practical teaching given by science teachers in secondary school, seem to be increasing pupils interest, having dialogues around science and to learn practical science. The same teachers say that the factors that hinder them from making desired changes are size of classes, the teachers' competence and time.

Keywords: science education, secondary school, pupils-active, curriculum, interview

INTRODUCTION

A survey from 2008 by Olsen et al. (2010) is the background for this investigation. Their results showed that teachers who had specialized in science use practical work for the pupils in their science lessons, more than average in Norway (Martin et al., 2007). Still, many of them wanted to make the lessons even more practical, and the pupils more involved and active (Sørmo et al., 2010), Inquiry–based learning (Spronken-Smith et al., 2007) and other methods in the term of constructivism (Quale, 2007) seemed to be the motive mainspring for the teachers.

What reasons can be found to explain the teachers wish for more activity, and what hinders them from doing that? This investigation focuses on teachers in secondary school and to elaborate their opinions about what limit their science teaching.

METHOD

A questionnaire (52 questions) about science teaching, limitations, classes, teaching methods, the curriculum, the school, and questions about whether the teachers want to change anything, was sent to 35 secondary school science teachers on 16 different schools in Troms County in Norway. We got answerers from 25 teachers from 12 of the schools. The answers were used to select four informants that wanted to change their teaching practice in their science lessons to an even more activity based way of teaching. The informants were interviewed (semi structured) about their teaching methods, their practical work in science lessons, and what limited their science teaching and their work priority in the lessons, to try to identify what factors hinder them from changing their teaching the way they actually want to.

RESULTS AND DISCUSSION

The whish to change teaching methods

The teachers wanted to change their classroom teaching in many ways (Table 1, results from questionnaire). The teachers answered that what they wanted most to do more was "Visits to museums, industry etc.", but also as many as 75 % wanted to do more "Field work and excursions". Also "Working in Groups" (58 %) and "Pupils do experiments" (50 %) scored high.

The results from the interviews of the 4 informants in our investigation seem to correspond with that point of view. They said that they wanted to do more thorough activities, more practical science and more dialogue around the activities. This seems also to be in correspondence with litterature, as an investigation on Norwegian pupils in 7^{th} grade indicated that pupils preferred teaching with activities (Tveita et al., 2003). The same investigation showed that the pupils' attitude to science was better in classes where the teaching was based on activities. TALIS (Vibe et al., 2009) reported that Norwegian teachers find it important that the pupils can think and try out hypothesis themselves and that the pupils thinking and reasoning is more important than the right answers.

Table 1. Science teachers wish to change their working methods (to have more of some activities) in the classroom. Answers from 24 teachers on questionnaire.

Working methods in science teaching	No change	More often
Pupils do experiments	12	12
Working in groups	10	14
The budding researcher	17	7
Field work and excursions	6	18
Drama and role play	20	4
Discuss science from media	17	7
Outdoor teaching	15	9
Using computers	20	4
Using internet	19	5
The pupils participate in planning the lessons	13	11
Visit to museums, industry etc.	3	21

Limitations for a more active science teaching

There seems to be many factors that limit the science teaching (Table 2, from questionnaire). Most problematic seems to be transported to excursion areas" where as many as 16 teachers (65 %) state that this hinders their science teaching and this also correspond and explains the results presented in Table 1 about what they wanted to do more.

Table 2. Hinders for science teaching for teachers in secondary school. Replies from 25 teachers.

Limiting factor:	not at all	small grade	some grade	much
An own teaching room for science	12	2	2	9
Equipments at school	2	5	14	4
Economy at school	1	10	9	5
Transport to excursion areas	3	6	7	9
Teamwork among science teachers	6	9	7	3
Pupils interest	6	10	6	3
Number of pupils in science class	5	8	8	4

When interviewed about the same, two informants said that practical science teaching required a lot of preparation, and thus available time seems to be one of the most limiting factors. They thought it was very individual how much time science teachers would spend on this work. Two informants mention the size of the science classes and the economy as a limitation. Three informants are telling about lack of modern equipment.

CONCLUSIONS

The science teachers interviewed already have activity based teaching in science but they state that this is important and they all want to have even more activities. The reasons that they cannot obtain this are above all lack of time for preparations, but also economy, the teachers own competence and number of pupils in science class limits them.

ABSTRACT

There is a widespread agreement within the scientific community about the main factors which hinder new scientific vocation from coming out: the lack of interest and negative attitudes toward science and technology amongst the youth; moreover, they are the obstacles that stand in the way of restructuring the relationship between science and society. This work identifies what kind of difficulties arises by the category *culture* when interpreting the attitudes and opinions of the youth through science and technology. We describe the context where science is democratized, compelling the scientific and technological system to keep a constant dialogue with the emerging political powers of society, and finally we explain what the advantages are of including a concept of identity when making a critical reflection of the challenges that the construction of the "European model of science in society" must overcome.

Keywords: *culture, science, technology and society (STS), identity, science education.*

INTRODUCTION

There is a widespread agreement within the scientific community with respect to the lack of interest and negative attitudes toward science and technology amongst the youth, that they are the main factors that hinder new scientific vocations from coming out and they will be the obstacles that will shape the scientists who initiate the "European model of science in society," scientists whose objective is to create a new *scientific citizenship* in society using the process of *scientific democratization* as the medium (MASIS Expert Group, 2009).

The significance that diverse groups have given to the problem that the image of science is being belittled in the eyes of the youth (for example, OECD, 2000) has led to studies being carried out, which identify the causes of this situation and suggest actions of intervention; has led to the interpretation of results of international studies that surveyed the opinion of the youth with respect to science, results which have given rise to models that attempt to restructure the relationship between science and society.

RESULTS

This is not empirical research, but a theoretical reflection about the relationship that connects three issues: *culture* as analytical category, the identity as a subjective dimension, and science and technology as social issues. In this reflection, we used some results from the Rose Project. These revealed that the more developed a country was, the smaller the interest its youth had in science and technology. The project also revealed that gender determined the views, values, interests and attitudes toward science (Sjøberg and Schreiner, 2008). These kinds of results have been interpreted, like others, from the perspective of *cultural differences*. However, the category *culture* cannot explain, for example, why boys from developed countries, like the other boys and girls from developing countries, think that science and technology can solve all of the environmental problems, and that the solution is to be left to the experts; while the girls of those same developed countries, along with Japanese boys and girls, appear to be more skeptical and critical in the face of the role of science. In these cases, the category *culture* is not able to interpret these incoherencies.

Regarding the models that suggest restructuring a new relationship between science and society, the recent publication *Challenging Futures of Science in Society: Emerging Trends and Cutting-edge Issues* puts special value on the categories *culture*, *multiculture* and *pluriculture* as ground conditions for democratic participation (MASIS Expert Group, 2009).

The problem that arises when using the concept of culture to interpret the results of international studies that survey opinion and in the design of models that attempt to reconfigure the relationship between science and society, is the same problem that the social sciences face when trying to reformulate the concept of cosmopolitan citizenship. Studies done in philosophy, politics, and sociology have revealed that the concept of culture, conceived during the 18th century with the impetus of european colonialism, brings out more problems than answers when it defines the role of the postmodern subject of post-industrial and global societies. Introducing concepts of *culture*, *multiculturalism*, *interculturalism* or *pluriculturalism* when describing present societies we make the mistake of understanding culture only as homogeneous, unified, holistic and self-coherent groups, as whole groups that have no interior conflict, where the strength of tradition submits particular identities (Benhabib, Honig, Kymlicka, Post and Waldron, 2008; Nussbaum and Glover, 1995).

CONCLUSIONS

In this work we have identified the main problem we face when the category *culture* is used in order to interpret the attitudes and opinions of the youth about science and technology. Nowadays the category *culture* does not allow us to explain social phenomena in contemporary societies where its people do not base their identity using conventional references such as nationality, language, gender or race.

ABSTRACT

We present an analysis of an ecological citizen science monitoring program called "NatureWatch". In our study we explored the successes and challenges of an ongoing collaborative partnership involving elementary and secondary schools, faculty of education, and a federal government agency. Using Wenger's theory of *communities of practice* (CoP) we analyzed this program and discovered that it aligned well with this theory. Importantly, using Wenger's principles helped explain the successes and challenges that were exhibited throughout the duration of the partnership. Based on our findings, implications for the development of ecological citizen science monitoring programs in schools are presented.

Keywords: *citizen science, schools, communities of practice, ecological monitoring.*

INTRODUCTION

In this presentation we provide an analysis of an ecological monitoring partnership amongst elementary and secondary schools, faculty of education, and a federal government agency. Specifically, we report how the Ecological Monitoring and Assessment Network (Environment Canada, 2008) citizen science program called "NatureWatch" was adapted by schools, and explore the successes and challenges of this collaborative partnership.

NatureWatch is a suite of ecological monitoring and assessment programs, which include: *FrogWatch, PlantWatch, WormWatch,* and *IceWatch*. The Ecological Monitoring and Assessment Network (EMAN) is made up of organizations and individuals across Canada involved in ecological monitoring to better detect and report on ecosystem change. To support environmental education curriculum goals, in 2006, a collaborative partnership was established with an elementary school aligning with EMAN ecological monitoring activities. This partnership is ongoing and has been extended to include an additional elementary and secondary school. Our research focused on how this partnership: (a) influences the efficacy of implementing these programs within elementary and secondary schools; and, (b) nurtures the development of ecological literacy with students and teachers.

METHODS

This research design is a qualitative case study (Creswell, 2003; Stake, 2000) of 'NatureWatch' implementation within two elementary and one secondary school This approach involves empirical investigation of particular phenomena within an authentic context. For the purposes of this research, a case study methodology is appropriate because of our research questions, design considerations, and pragmatic concerns. Research data consists of: (a) pre and post semi-structured interviews of key participants' views of in-service and implementation and, (b) researcher's narrative accounts as marginal participants during inservice, and implementation of the protocols at the school sites. Semi-structured interviews solicited basic participant information, familiarity with protocols, and understandings around citizen science, and ecological literacy prior to and after implementation in the school community. Direct observations, via narrative accounts of teacher inservice and implementation, complemented data obtained from interviews. Specifically, the researchers acted as marginal participants during these activities, and as 'participants-as-observers' during EMAN protocol activities.

RESULTS

Our findings are based on our analyses of interviews, field observations, professional development sessions, and various documents amongst three school cases. The evidentiary data presented in the findings were organized around patterns of data found across all three school cases.

In general, our results indicated that *NatureWatch* is a viable model for implementing a citizen science ecological monitoring program within schools. However, in order to fully realize the full potential of this program within schools, a deeper understanding is required by all participants regarding the purpose of community-based monitoring, the presence of necessary human and material resources to effectively implement ecological monitoring protocols, and a fundamental understanding and framework for creating and sustaining partnerships.

Using Wenger's (1998) notion of CoP we were able to analyze this school-university-government partnership from a systems perspective. This partnership aligns well with Wenger's characteristics and suggests that the development exhibited in this partnership can be attributed to the creation of a CoP. Accordingly, three basic characteristics were used to describe the partnership as a community: engagement, alignment, and imagination. More importantly, using Wenger's concepts helped explain the interactions between novices and experts participating in the partnership, and provided explanations for the successes and challenges that were exhibited throughout the duration of the partnership.

CONCLUSIONS

Our findings suggest that 'NatureWatch' is a viable model for implementing a citizen science ecological monitoring program with schools and, as such, supports EMAN's program objectives. Biodiversity data had never been collected by EMAN from various schools' geographic areas. This increase in geographical coverage of monitoring information is a specific goal of the program, thus allowing better detection of ecosystem change in the schools' regions. Clear engagement and alignment with the program's domain was demonstrated by all participants.

Partnerships between government agencies and schools are inherently challenging. Hence, considerable efforts are required to forge relationships because of the contrasting structures and frameworks of the respective institutions. "Building bridges" between diverse institutions requires skilled facilitation necessary to promote trust and cooperation

This partnership aligns well with Wenger's characteristics and suggests that the development exhibited in this partnership can be attributed to the creation of a CoP. More importantly, using Wenger's concepts helped explain the interactions between novices and experts participating in the partnership, and provided explanations for the successes and challenges that were exhibited throughout the life of the partnership. While successful, our community project had challenges, including sustainability of the partnership over time. Other challenges included: cultivating a community, developing effective knowledge structures that evolve with the project, and leadership for the various subgroups. These are critical areas that require further research and development for promoting environmental education in school contexts, and supporting sustainability efforts in communities.

PROMOTING PUPILS' INTEREST IN SCIENCE – SOME NEW APPROACHES IN POLAND

Anna Florek

Department of Chemistry
University of Gdansk, Poland

Rajmund Kaźmierkiewicz

Intercollegiate Faculty of Biotechnology
UG-MUG, Poland

e-mail: rajmund@biotech.ug.gda.pl

ABSTRACT

The purpose of this work is to propose a range of methodologies for the inclusion of modern research methods used in science (e.g. molecular modelling, electrophoresis, mass spectrometry,) within the school curricula and practice in Poland at upper secondary level. The main educational goal is to develop a student's interest and inspire their curiosity for the study of chemistry and science at school level. The inclusion of teaching material about modern techniques and their uses in disciplines such as medicine and the technology involved in the production of everyday materials can develop student motivation and hence provide a more effective science education. The main focus is for students of non science specialists classes. Emphasis is given to the implementation of modern knowledge into present day curricula and to find a way for a methodological connection between obligatory and modern topics. All projects have been tested with groups of students during preliminary school lesson and laboratory activities. The potential of the projects in school practice and their effectiveness are evaluated using a range of techniques.

Keywords: *new topics, methodological projects, educational tools, students' interest of science*

In chemistry and science education it is important to offer the postsecondary school students information about the development of chemistry and other science disciplines and that students will be able to make a more informed choice for their future career. A further key aspect is to show our students how modern, useful and interesting chemistry is in our time (Nelson, 2005).

The main educational goal is to encourage a form of teaching which would enable students to understand some issues about improving and implementing modern technologies in science. In the projects an important goal is to find the most interesting application of modern research techniques concerned with the connection of applications of these two issues of students needs and interests (such as health, diet, beauty, everyday equipment, problems discussed in the mass media). It is necessary to find the best solutions, both educationally and structurally, for teaching interdisciplinary problems during traditional chemistry curses (Florek, 2007).

To prepare these educational projects it was necessary to search resources of science news, analyses the content of current school curricula, choose new topics and prepare different kinds of methodological projects together with any didactic tools for students and teachers. The main subject of that work was modern research technologies used in science (e.g. molecular modelling, mass spectrometry, electrophoresis etc.). For example the computer research method -molecular modelling- is one of the fastest growing fields in science. It may vary from building and visualizing molecules to performing complex calculations on molecular systems (Ercolessi, 1997; Wales 1999). Using molecular modeling scientists will be better able to design new and more potent drugs and a vast array of new materials (protein engineering). Electrophoresis (with polymerase chain reaction PCR) is the analytical chemistry development for research of DNA and the genetic code (Matthews, 1997).

I am designing a range of new methodological projects for school lessons (at the post-gymnasium level) which can bring these new topics together with traditional topics. The projects have been designed to be easy to use in school classes. The project has been tested by groups of students from Gdansk's schools during preliminary school lesson and laboratory activities during the last year. The effectiveness of the project was evaluated using a range of techniques. The results provide the data for the evaluation and the improvement of the projects. Mostly the preliminary results show an increase of students' motivation and interest in science. In addition, the results show the importance of offering the postsecondary school students information about the development of chemistry and other science disciplines and that these students are much better placed to make informed choices about their future career. The other aspect is to show our students how modern, useful and interesting chemistry is in modern times.

STUDY ON INNOVATION AS STRATEGY FOR SCIENCE TEACHERS' CONTINUING EDUCATION

Paulo Sérgio GARCIA

Universidade de São Paulo, Faculdade de Educação, SP, Brasil.

garciaps@usp.br

ABSTRACT

In Brazil is common to use pedagogical innovations to legitimize traditional projects. This study examined the effects of an innovation project on science teachers' continuing education. We interviewed 11 teachers from three elementary schools. We collected data utilizing four categories: "situating the innovation", "implementation obstacles", "innovation type", and "innovation origin". The data showed that the use of pedagogical innovation as a strategy for teachers' continuing education reduces the learning process. The lack of support, time, and continuity are some of the obstacles. The findings presented here bode well for future analysis on the use of innovation on science teachers' continuing education.

Key words: *Innovation. Change. Science teachers' continuing education.*

INTRODUCTION

In Brazil, annually, schools receive many innovations with a variety of objectives, among them, those related to science teachers' continuing education. Nevertheless, the innovations have not been exploited in systematic studies like in other contexts.

In the European context, for example, the research of Huberman (1973) contributed to better understand the role of people involved in the innovative processes. Gonzáles y Escudero (1987) discussed the process of innovation development, focusing on the innovation' concept; Hernandez *et al*, (2000), Cardoso (2003), Correia (1989), and Carbonell (2002) are other authors that contributed with ideas and thoughts.

In the American context, the studies of Fullan (1992, 1993 and 2001) were determined to the understanding of innovation and educational change. In Brazil, we highlighted the work of Garcia (1980), and Krasilchik (1980) and (2000).

It is common in Brazil to use innovation project to solve educational problems. The term is used to legitimize old fashioned projects, and to standardize practices, not considering the diversity of social cultural context. The term is also used to describe improvements in quality of teaching, and as a strategy for science teachers' continuing education. Nevertheless, the innovation keeps a distance from simplistic thought, does not have a unidirectional meaning, and characterize itself much more as a process than a product.

Generally, the implementation of innovation is accompanied by some obstacles (Fullan & Hargreaves, 2000), and marked by the complexity, and by the impossibility of controlling its effects (Fullan, 2001 e Carbonell, 2002). In this way, the relationship between innovation and science teachers' continuing education is not so simple and straightforward, and many studies have already indicated the need of overtaking this utilitarian model and focus on institutional and professional development (Moreira, 1999). Nevertheless, it is common, in our country, the use of innovation as an end in itself, or as a strategy to solve educational problems. This study aim at investigating the effects of an innovation project on science teachers' continuing education.

METHODOLOGY

The overarching research question being addressed is: which are the effects of an innovation project on the science teachers' continuing education? To address this question in 2004 and 2007 the interview technique, with a previously defined script, was used with 11 teachers from three public schools in São Caetano do Sul, Brazil, who participated in the project from 2002 to 2006.

The data were collected utilizing four categories: 1) "situating the innovation", 2) "obstacles that impede the implementation of the project", 3) "type of innovation", and 4) "origin of innovation". In our questionnaire, the category "situating the innovation" analyzed how the teachers situated (understand) the innovation in relation to their continuing education; the category "obstacles that impede the implementation of the project" described the obstacles noticed by the teachers that hinder the implementation process. The category "type of innovation" showed which innovation' dimension was used, comparing to those proposed by Fullan (2001). The last category "origin of innovation" investigated the origin of the project and the implications to science teachers' education. We also analyzed all the innovation documents.

This project of innovation was promoted as a partnership between the São Caetano' Department of Education and the University of Sao Paulo. Innovation, which began in 2002, brought two major objectives: 1) the purpose of developing an innovative science education by combining science and telecommunications, integrating materials, laboratory experiments and demonstrations, and the exchange of information among schools in Brazil, and 2) the purpose of changing the science teachers' practice.

RESULTS AND DISCUSSION

Data analysis made possible to better understand about the use of innovation on science teachers' continuing education.

Teachers understood (situated) the innovation under a multiplicity of concepts, mainly, linked to changing, new and learning. Nevertheless, although teachers said that learning was one of the important outcomes of the project, they also said that other factors ended up attenuating this effect of innovation: the lack of time to discuss the implementation of the project; the difference between school and project' objectives; the lack of continuity, are among other factors that reduce learning process.

As to the obstacles that impede the implementation of the project, we could classify it in three kinds of factors: personal (lack of interest, anxiety, lack of confidence), professional (lack of support, lack of time, overload of working, lack of leadership), and contextual (lack of financial support, lack of resources). Some of these factors were already described in the literature: the overload of working (Fullan & Hargreaves, 2000); the organization and the functioning of school (Thurler, 2001), lack of time, support and the size of changing (Fullan, 2001).

With respect to the type of innovation, we found in the project documents the three dimensions proposed by Fullan (2001): 1) the introduction of new material such as curriculum or technologies; 2) the use of new teaching approaches, and 3) the modification of teachers' beliefs. Nevertheless, teachers identified only the first dimension. It means that the innovation did not affect teachers' beliefs, for example. Fullan used to say that to have good results we need to combine all three dimensions.

The results of this study showed that, even after five years of participating on the innovation project, teachers did not change their practice, and they were not using science and telecommunications in their normal classes. In this project, specifically, the results were small in comparison with the resources and time spent.

The data also indicated that we have to have some caution to assume innovation as a strategy on science teachers' continuing education. In fact, some studies have already suggested the need of overcoming this instrumental model, and recommend focusing on new strategies for institutional development (Moreira, 1999).

ABSTRACT

This paper reports results of a study about the Qualitative Computer Modelling using the Qualitative Computer Modelling Environment ModeLab². The study was developed based on an Extension Course offered to Physics novice university students at Federal University of Espírito Santo, Brazil. The study aimed at investigating also the efficiency of the collect data tools integrated in the Environment ModeLab². Results show that students were able to build models based on a short guideline text about the proposed system and to implement it in the ModeLab², and analyze them through the visualization of the graphical behavior generated by the simulation and, finally, validate or refuse them based on the observed behavior. The data collection tools allowed a considerable optimization of time to data collection for both the way data is generated and the easy access to data of the Model Building Process. These results lend support for the ongoing investigation about the integration of the ModeLab² in Science Education tasks with larger samples.

Keywords: *models, modeling, qualitative modelling, computer modelling environment.*

INTRODUCTION

The study of integrating information and communication technologies in Science and Technology Education has been the focus of a number of research programs around the world. Within this context, a number of contributions can be found related to the development of either computer modelling environment or modelling activities for applying them to the educational context (e.g. Ogborn, 1994; Gomes, 2008; Ferracioli, 2004; Gomes & Ferracioli, 2006). A ***Qualitative*** Computer Modelling Environment named *ModeLab²* (Ferracioli, 2004; Gomes, 2008), acronym of **Model**ling **Lab**oratory **2**D, was developed for integrating concepts of models and modelling in science classes through expressive activities and investigating cognitive modelling based on this kind of activity aiming at searching for modes of reasoning. Besides, the ModeLab² was developed with tools for collecting data and following-up activities to help the data analysis of the whole data generated by the investigation. This paper presents results of an investigation about this environment with expressive modelling activities developed by novice university students of Physical Sciences. The ModeLab² is available at http://modelab2.modelab.org.

THEORETICAL FRAMEWORK

Within the scientific context to study the world around us scientists choose specifics systems, phenomena or events to build models aiming at being able to explain and understand them. In this sense, *Models* are helpful to study structures that cannot be reached easily. A *Model* is a structural analogous of the world that has only some pieces of the reality and *Modelling* consists in to choose specifics pieces of the object, system or phenomenon of interest according to the focus of the study and build *Models* about them. Concepts like *Models* and *Modelling* can improve the learning process in the Educational Context and a way to introduce these concepts into it can be done using *expressive modelling activities*: students are requested to build models based on their own ideas about a proposed system. One of the ways how models are built on a Modelling Environment is concerned only with the objects of the system and the rules of interaction between them. This kind of Environment is classified as ***Qualitative*** Computer Modelling Environments (Gomes, 2008).

METHODOLOGY

To carry out the study was designed an Extension Course with 4 modules lasting 50 min and 1 module lasting 100 min. The data collection instrument consisted of two parts: an Instructional Material, used in the three first modules of the Extension Course with the focus on the Qualitative Computer Modelling Process; and Data Collection Instrument, used in the *Fourth* and *Fifth Modules* to collect data to the study. In the Fourth and Fifth module, students working in peers were asked to build models about two systems: a gas expanding inside a closed room and a predator-prey-like system with rabbits and foxes living in an isolated area. The data collected in these two last modules generated a Data Protocol based on students' peer dialogs while developing the expressive modelling activity, students' peer written material, the video recorded from computer screen, the *ModeLab²* *Log File* with the actions done by students while building models on the *ModeLab²* and the final model structures build by students on that environment.

RESULTS AND CONCLUSIONS

The data collected had inherent qualitative nature and to analyse them was used the Systemic Network technique (Gomes, 2008), where were considered aspects related to the Computer Modelling Process. Results show that all students were able to build models with the Qualitative Computer Modelling Environment ModeLab² based on their own ideas. All models built by students about the Gas Expansion presented the expected behaviour and for the other system was the half of models. This result lend support to the used procedure, *Computer Modelling Process*, which begins with the Steps for Building Models developed ***on paper*** and afterward representing it on the Environment *ModeLab²*: this procedure lead students to think-reflect-organize their own ideas about the target-system for building a first model on paper according to their ideas and subsequently to transfer it to the *ModeLab²* Environment. Regarding to the Tools for Collecting Data and Following-Up the activities development, the results show that they attached valuable and crucial contributions related to the organization, visualization, time consumed for accomplishing the data analysis. An remarkable example was the fact that a small bit of information recorded from screen and audio was lost from one of the peers: the use of the *ModeLab²* Log File facility allowed to rescue the essence of the lost information and not missing it for the whole analysis. These result lend support to the use of the Qualitative Computer Modelling Environment *ModeLab²* for integrating information & communication technologies in Science Classes through expressive or exploratory modelling activities (Gomes et all, 2008; Fehsenfeld & Ferracioli, 2009). The collecting data tools result consolidate the research branch with larger samples focusing on the investigation of qualitative computer modelling in two main perspectives: elicitation of students' conceptions about science topics and the understanding of knowledge structure building process based on causal structures.

ABSTRACT

Problem-Based Learning (PBL) curriculum in medicine was first introduced in 1969 at the McMaster Medical School in Hamilton, Canada. The first European PBL curriculum was introduced at the University of Maastricht Medical School in 1974. PBL is most often used to facilitate students' integration of basic and clinical sciences and not as a replacement of the standard medical curriculum. During PBL students develop problem solving skills and use relevant facts (triggers) from case studies to define their own learning objectives. The objectives of PBL are to increase knowledge and understanding with the aid of case studies. In addition PBL also facilitates the acquisition of communication skills, teamwork, independent responsibility for learning and sharing information. This paper focuses on the anatomy of tutorial groups and participants' roles. It presents the key steps in the PBL discussion process and the seven jump method. In conclusion, the advantages and pitfalls of PBL are discussed.

Keywords: *problem-based learning, discussion leading, cases studies.*

INTRODUCTION

Many countries have recognized that traditional undergraduate medical education must change substantially in order to match the changing healthcare needs of the population and become centred on the students (Maudsley, 1999; Christopher, Harte & George, 2002). The more recent use of PBL can be traced to North America in the 1960s. A number of medicals schools introduced some problem-based, self-directed, student activities (Harris, Horrigan & Ginther, 1962). But the credit for the introduction of the first PBL curriculum belongs to the McMaster Medical School in Hamilton, Ontario, which was started in 1969 after three years of planning (Neufeld & Barrows, 1974). The first European PBL curriculum was introduced in the University of Maastricht medical school in 1974. This course lasts six years and comprises four years of pre-clinical PBL course and two years of conventional clinical clerkships. PBL has remained a key feature at the University of Maastricht and is used in other degree courses beside medicine – Health Sciences, Law, Business Studies, and Economics.In 1993, three systematic reviews of PBL in undergraduate medical education were published. These reviews, spanning 20 years, were optimistic about the short term and long term outcomes of PBL compared with traditional approaches (Vernon & Blake, 1993). This paper focuses on the anatomy of tutorial groups and participants' roles. It examines the responsibilities of PBL tutors in undergraduate medical curriculum. It presents the key steps in the PBL discussion process and the seven jump method. In conclusion, the advantages and pitfalls of PBL are discussed.

TUTORIAL GROUPS

A good group size is eight to 10 students. The role of the chairperson and scribe should be rotated through the whole tutorial group. The number of sessions and the length of time that the group stays together vary between institutions. Students should stay within a single tutorial group for a block, module or semester, around seven to 14 weeks. A tutorial group may spend one to one and a half hours on a new problem plus one to one and a half hours discussing a previous problem. The role of the chairperson is to lead the group through the process, investigate who the group members are and to introduce them. He has to make agreements with group members about the procedure of the discussion and then introduce the problem for discussion. He must keep to time and maintain the group dynamics. The scribe has the important role of note-taking and recording the points made by the group. He also helps them to order their thoughts.

Tutoring in PBL is quite different from lecturing. Effective tutoring involves knowledge, guidance and requires intense concentration. Discussion leading is an art form. But like all arts, we have to be shown how to do it, and we get better with practice. The strength ob PBL is that it can be vigorous and more engaging than a lecture because students are involved trying to put ideas into their own words. So above all, PBL needs structure and key points. The first key point is advance preparation and giving out the case one or more weeks ahead of time. Then the tutor chooses a case with controversy, "a case is a story with an educational message" and what makes it a good story is controversy. He has to set the scene for the case to warm up the audience before blurting out the first question. He must use a good opening question, involve as many people as possible, and ask NON-threatening questions, control the discussion, correct student error and structure the discussion.

THE SEVEN JUMP METHOD

PBL tutorials are conducted in several ways. In this paper, we are presenting the Maastricht "seven jump" process. For the first meeting there are five steps. At the beginning we have: to identify and clarify terms and concepts not readily comprehensible; the scribe lists those that remain unexplained then, to define the problem to be discussed, the students may have different views on the issues; the scribe record a list of agreed problems, "Brainstorming" session to analyse the problem and offer tentative explanations; the scribe records all discussions, draw up an inventory of explanations; the scribe organises the explanations, formulate learning objective. The group reaches consensus on the learning objectives. The tutor ensures that the learning objectives are achievable, comprehensive and appropriate. Between meetings the students must: collect further information through private study. For the second meeting: they have to synthesize new information, evaluate and test it against the original problem, reflect on and consolidate learning.

PITFALLS AND ADVANTAGES OF PBL

The main lethal pitfalls that must be avoided at all cost are: not understanding how PBL works, poor planning and not doing enough work. Tutors that enjoy passing on their knowledge may find PBL frustrating. The students may be deprived access to a particular inspirational teacher who in traditional curriculum would deliver lecture to a large group (Wood, 2003). PBL is not about problem solving per se, but rather it uses appropriate problems to increase knowledge and understanding. Most students enjoy active participation and consider the process to be relevant, stimulating and fun (Des Marchais, 1993). The learning environment created by PBL is more convivial for students (Blight, 1995). PBL fosters self-directed learning skills (Norman and Schmidt, 1992) and promotes deeper rather than superficial learning. The medical education literature abounds with publications on PBL, which have produced lively debate. But the question remains: does PBL produce better doctors? Choon-Huat Koh and his colleagues (2008) conducted a systematic review of evidence of the effect that PBL during medical school had on physician competencies after graduation. The conclusion is that PBL during medical school has positive effect on physician competencies especially on the social and cognitive dimensions. Future research should look beyond knowledge competency and measure the effect of PBL on other dimensions of physician competency.

CONCLUSION

Problem-based learning is a combination of educational method and philosophy; philosophically is centred on the student and on problem-first learning, whereas in subject learning teachers transmit knowledge to students before using problems to illustrate it. PBL aims to enable students to acquire and structure knowledge in an efficient, accessible, and integrated way. The method involves learning in small groups in a tutorial system. The tutor facilitates the group's self directed generation of learning objectives from triggers in successive case scenarios that set the context. These objectives guide self directed learning between sessions, and then in subsequent sessions students reapply, synthesize, and appraise their learning.

BRIDGING THE GAP IN LACK OF PROFESSIONAL INSTRUMENTATION – SMALL-SCALE, LOW-COST ANALYTICAL INSTRUMETNS FOR GREATER EQUITY IN LEARNING ANALYTICAL CHEMISTRY

Nataša Gros

University of Ljubljana, Faculty of chemistry and chemical technology
Aškerčeva 5, SI-1000 Ljubljana, Slovenia

natasa.gros@fkkt.uni-lj.si

ABSTRACT

This contribution challenges the often misleading opinion that there is only one way of doing analytical chemistry and that is - with complicated professional and costly instrumentation. A low-cost spectrometer with a microreaction chamber and a tri-colour light emitting diode as a light source is described. The spectrometer can be easily upgraded into several different analytical instruments e.g. a gas and a liquid chromatograph, a flow injection analysis system with the spectrometric detection and a spectrometric microtitrator which all enable sound introduction of fundamentals of instrumental analytical methods by hands-on approach and are suitable for real life applications.

Keywords: *Instrumental analytical chemistry, Low-cost instruments, Hands-on approach, Equal opportunities, Spectrometer*

INTRODUCTION

Rapid technological development requires professionals with excellent analytical chemistry skills to monitor technological processes and their impact on the environment, and to control food safety and people's health. Students currently enrolled at vocational schools of different non-chemical sectors will be even more in need of the knowledge and skills of analytical chemistry, strongly required also by their future employers. Practical work is an essential part of learning analytical chemistry. Professional instruments are very costly and even not always very suitable for teaching the basic concepts of analytical methods. Vocational schools in different sectors and different countries do not have equal opportunities for teaching analytical chemistry, since they are not equally well equipped and do not devote equal parts of teaching time to laboratory work.

The hands-on approach in teaching and learning is believed to contribute to better understanding of the concepts taught. However, this approach is difficult to introduce, if costly instrumentation is required. Therefore even for modules on instrumental analysis at tertiary level of chemical education, activities of the students are in some cases limited only to preparatory phases, while actual measurements are carried out by the demonstrator. The reasons why analytical chemistry is usually neglected at lower levels of chemical education are manifold. Most commercial instruments are expensive and their operation and maintenance are demanding, therefore most secondary school chemistry teachers are not knowledgeable enough to cope with the technology on the one hand and theory on the other.

Possibilities which enable some of these drawbacks to be overcome are simplification and miniaturization of analytical instruments. This contribution describes the low-cost spectrometer with a microreaction chamber and a tri-colour light emitting diode as a light source which can be easily upgraded into several different analytical instruments e.g a gas and a liquid chromatograph, a flow injection analysis system with the spectrometric detection and a spectrometric microtitrator which all enable sound introduction of fundamentals of instrumental analytical methods by hands-on approach and are suitable for real life applications.

METHODS

A starting point for the construction of a tri-colour light emitting diode-based in situ spectrometer was the decision to put polymeric supports, called blisters—and used in the pharmaceutical industry for packaging of pastilles—into the function of reaction and measuring chambers. A prototype of the spectrometer was constructed and the novel optical geometry patented (Gros, 2001).

The specific of the geometry of the spectrometer is that the light of a tri-colour light emitting diode (LED) with emission maximums 470, 565 and 660 nm (blue, green and red light) passes through the solution in the vertical direction and falls directly on a photo-resistor, which lies under the microreaction chamber. A tri-colour LED functions as a light source, the blue, green or red light can be selected. The equality of path length of the light within the series of measurements is achieved by a control over the volume of solutions in individual hollows of a blister, e.g. by using micro-pipettes for measuring the sample and the reagent volumes or by drop based experimental approach. The bottom of the measuring chamber is designed so that it supports the blister in different positions, enabling spectrometric measurements to be made for different hollows of the blister. The measurements are expressed as transmittance (%). Experiments demonstrating additive mixing of colour can also be performed with the tri-colour LED. The prototype was later transformed into more robust and even easier to handle Spektra™ spectrometer by the Laboratorijska tehnika Burnik d.o.o., Slovenia. The Spektra™ spectrometer has emission maxima at 430, 565 and 625 nm.

RESULTS

The spectrometer for educational purposes was upgraded into several other analytical instruments (Gros, 2005, Gros & Vrtacnik, 2005, Gros, 2007) or connected to a personal computer as indicated in Figure 1. Through the two EU Leonardo da Vinci projects “Hands-on approach to analytical chemistry for vocational schools” and “Hands-on approach to analytical chemistry for vocational schools II” several experiments from different chemical and chemistry related disciplines were developed for this equipment and published on the web pages of the projects with acronyms AnalChemVoc and AnalChemVoc II (FKKT, 2008).

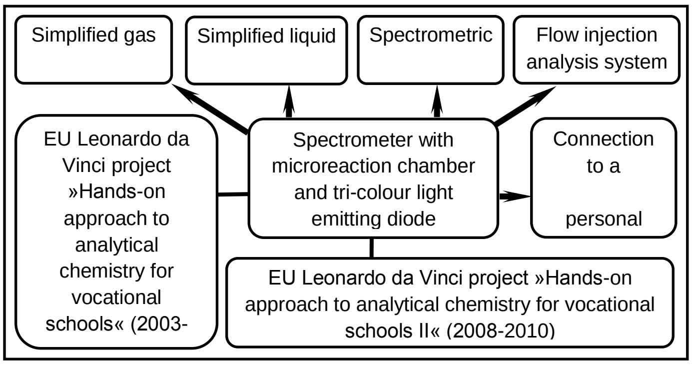

Figure 1. Upgrading of the spectrometer Spektra™ into other analytical instruments and the related EU projects through which several experiments for this equipment were developed

CONCLUSIONS

The approaches described here can contribute not only to more equal and better opportunities for teaching and learning analytical chemistry but can also rise the innovative potential in teachers and students by challenging the often misleading opinion that there is only one way of doing analytical chemistry and that is - with complicated professional and costly instrumentation, and if a school or university does not possess such instrumentation or has no access to it there is no other way.

THE USE OF WOODLANDS AND GREEN SPACES BY KINDERGARTENS

Inger Hilmo

Oslo University College, Faculty of Education and International Studies

Inger.Hilmo@lui.hio.no

Kari Holter

Oslo University College, Faculty of Education and International Studies

Kari.Holter@lui.hio.no

ABSTRACT

The use of woodlands and green spaces by kindergartens
In our project in kindergartens the main aim was to identify relations between quality of life among children, patterns of usage, attitudes towards nature, preferences, factors inhibiting use, as well as restoration of the greenway area along the Alna river in Oslo. We also wanted to identify culture-specific norms and socialisation factors influencing nature-related activities. Pre-school teachers were asked some questions regarding where they go when they take the children on outdoor excursions, how often and why. Additionally, we had questions on reasons why some parents are sceptical to let their children spend a day out of doors in nature.

Keywords: *Kindergarten, childhood, nature, woodlands, sustainable development*

INTRODUCTION

The Norwegian authorities currently focus on outdoor activities as a pedagogical way of working in preschools. Arguments for this are both related to aspects of sustainable development and health. The hope is that a child who learns to love the nature will wish to preserve it. In our project in kindergartens the main aim was to identify relations between quality of life among children, patterns of usage, attitudes towards nature, preferences, factors inhibiting use, as well as restoration and management of the greenway area along the Alna river in Oslo. We also wanted to identify culture-specific norms and socialisation factors influencing nature-related activities. This project was part of the research project”Down by the Riverside”.

METHODS

In this project we collaborate with the Norwegian institute for nature research (NINA), Norwegian institute for cultural heritage research (NIKU), Norwegian institute for urban and regional planning (NIBR) and the Municipality of Oslo. Our main contribution is a questionnaire distributed to all the kindergartens in the area. We received response from 83 kindergartens, which amount to a response rate of 65 %. We asked pre-school teachers in the kindergartens some general questions regarding where they go when they take the children on outdoor excursions, how often and why. Additionally, we had specific questions on the Alna river area, and also on reasons why some parents are sceptical to let their children spend a day out of doors in nature.

RESULTS

Some of our findings were that more than 90 per cent of the kindergartens spent one day or more per week, outside in the nature during the spring, summer and autumn seasons. All preschool teachers who answered our questionnaire marked that children are interested in animals. The preschool teachers pointed at several advantages for the children (see table 1), and they came forward with suggestions for improving the greenway area along the Alna river. We also received replies that gave information about why some parents are sceptical against having their children spend several hours outdoors in nature.

Our study also points out the importance of good upkeeping and restoration of urban areas. Furthermore, many of our results coheres with results from investigations aimed at schools and the general public in the main project, “Down by the Riverside”.

Table 1

The following display comments about areas in the nature where children can stay during the day

Please compare your experiences from work with children in the kindergarten itself with work in the woods/in the areas along the river	Disagree %	Neither %	Agree %
Children have more opportunities for strengthening their feeling of self-confidence	1,2	3,6	94,0
The opportunities for working with language skills are poorer	79,5	4,8	12,0
Children develop their creativity better	2,4	7,2	87,9
Role play has poorer conditions	78,3	4,8	13,2
Children develop the ability to observe better	0,0	6,0	91,6
Children’s learning improves	1,2	15,7	81,9
There are more conflicts	93,9	3,6	1,2
Girls play more with boys	8,4	32,5	56,6
Boys play more with girls	7,2	37,3	53,0
Children play less with younger or older children	67,5	18,1	12,0

CONCLUSIONS

Our study reports on good developmental possibilities as to language, learning, a feeling of self-confidence and creativity for children who spend time in nature. International research who addresses the importance of nature in children’s lives supports these findings. It is however an obvious need for identifying gaps in current knowledge and to discuss how research questions in this area might be addressed with both care and rigor.

The pedagogical practises are obliged to be in the best interest of the child. Some parents in our study were worried that their children are freezing, might get lost or are not finding anything to do on outings while the preschool teachers valued being outside as an important ideology. These differences in opinions challenges how to include the children’s as active negotiable participants in their own lives.

The Framework Plan for the Content and Task of Kindergartens says that the aim is for children to begin to understand the significance of sustainable development. Further questions to reconsider are: How are outdoor activities connected to sustainable development? How does the pedagogy of today succeed concerning sustainable development?

ABSTRACT

The aim for the study is to examine if the way a question is constructed influences the result among girls and boys. Does it make sense for the results for girls or boys if the question is a multiple choice question or an open response question? To find out if the question format affects the assessment result a first analysis of data from the OECD study Programme for International Student Assessment (PISA) from 2006 has been accomplished. The result reveals that girls perform better when it comes to open response questions and boys are better off when dealing with multiple choice questions.

Keywords: *assessment, PISA, gender*

INTRODUCTION

An essential part of teachers´ work is related to assessment of students´ achievements in their studies. If the curriculum on the national level allows the teacher a high degree of freedom in choosing subject content and methods for teaching, as the Swedish curriculum do, this will also be reflected in the practice of teacher assessments. In a comparison between the Swedish curriculum from 1969 (Lgr 69) and the current curriculum (Lpo 94) the former strictly regulated all school activities while the latter gives a high degree of freedom in organization and realization of teaching (Gustafsson 1999).

This study focuses on Teacher Assessment according to Gipps´ definitions (1994), which are repeated assessments made by teachers in order to build up a broadly-based understanding of the pupils' attainment. When it comes to teacher made paper and pen tests, there are several ways to construct the assessments. Wedman (1988) lists the most common types of questions and organizes them in order from low grade of structure in responses to high degree of structure in responses. Essays are characterized by a low grade of structure while multiple choice questions and right or wrong questions have a high degree of structure. Questions with short open answers are found in the middle of the range.

In the OECD project "Programme for International Student Assessment" (PISA), mainly three types of questions were represented in the main study 2006 where science was the major domain:

- Multiple Choice questions (MC)
- Complex Multiple Choice questions (CMC)
- Open Response questions OR)

Three competencies are tested:

- Explaining phenomena scientifically (EPS)
- Identifying scientific issues (ISI)
- Using scientific evidence (USE)

With the PISA database available the possibility to do a quantitative analyze of the solution frequencies between boys and girls arises as well as the possibility to deepen the insight into what constitutes the differences. In addition to the structural type of question, subject content may result in gender differences. In this stage it is important to emphasize that there are several ways in which the items are categorized in PISA.

The main research question in this study is which parameter is the most important? Question format or competency?

METHODS

In the PISA database questions with a significant difference in solution frequency between boys and girls will be gathered and analyzed in order to categorize differences. For the statistical analysis SPSS will be used as analysis instrument to use question format as dependent variable when controlling for competencies and to use competencies as dependent variable when controlling for question format.

RESULTS

The PISA main study that took place in 2006 with science as major domain included 108 questions (in this study 99 items, 9 items are excluded from the database). In Sweden approximately 4 600 students at an age of 15 years participated in the assessment. A data analysis of the results has shown that in 33 questions there is a difference in results between girls and boys with a significance level of 5 %.

Table 1. Number of questions in science, PISA 2006, with a significant difference in results between boys and girls with respect to question format and competency dimension.

	Type of questions	Number of questions	Girl	Boy
Quest. format	MC	12	2	10
	CMC	11	7	4
	OR	10	8	2
Comp. Dimens.	EPS	15	4	11
	ISI	7	7	0
	USE	11	6	5

When it comes to open responses girls performed better than boys. On the other hand boys performed better in questions of multiple choice formats.

Cross-examination of the variables Question format and Competency for 99 items are presented in table 3 and 4. Critical value for the 5% level of significance for values > 5,991 with 2 df.

Table 3. Competencies as dependent variable when controlling for question format

	Value	df	Asymp. Sig. (2- sided)
Pearson Chi Square	15,645	2	0,000

Table 4. Question format as dependent variable when controlling for competencies

	Value	df	Asymp. Sig. (2- sided)
Pearson Chi Square	4,762	2	0,092

CONCLUSIONS

Eriksson (2005) has in his study from results in TIMSS shown that question format affects the assessment results between boys and girls. This study on PISA data confirms these results if we only consider the results in Table 1. However, the content to be evaluated also plays matter. When a χ^2 test is applied to control whether question format or competency affects the result most, we can no longer se that problems caused by question format are significant. When controlling for question format, competencies are significant and this implies that competencies have a bigger impact on the result than question format, when the variables are cross-examined.

TRANSFORMING MARS INTO A NEW "EARTH"? STUDENTS' SOCIO-SCIENTIFIC ARGUMENTATION IN A CHAT EMBEDDED IN A DIGITAL LEARNING ENVIRONMENT

Lena Hansson

Kristianstad University College

Lena.Hansson@hkr.se

Andreas Redfors

Kristianstad University College

Andreas.Redfors@hkr.se

ABSTRACT

In a European project, CoReflect, different digital learning environments are developed, implemented, and evaluated. All learning environments focus upon socio-scientific issues. The Swedish group has developed a learning environment focusing socio-scientific issues related to astrobiology. We report from the students' argumentation concerning the question *Should we transform Mars into a planet where humans can live in the future*? The students (16y) work together in small groups. Included in the learning environment is a *chat* function. The focus of this article is on the discussions in the chat, but also arguments used in other situations are discussed and compared.

Keywords: *Socio-scientific issues, argumentation, ICT, astrobiology, secondary school*

INTRODUCTION

Young people's lack of interest in science and science intense educations are a big concern for many stakeholders in western societies (e.g. Sjøberg & Schreiner, 2005). This has led to a call for a renewal of science education, with the aim of making more students feel that science is of relevance and importance for themselves, and for the society as a whole. There has also been an increasing acknowledgement of the importance of scientific knowledge among people, to make an active, and informed citizenship possible. Because of that many researchers in the field of science education suggest that work with "socio-scientific issues" (Ratcliffe & Grace, 2003) should be included in the teaching of science (Sadler, 2004). Including "socio-scientific issues" will prepare young people to deal with questions that they will meet as citizens. It is also a way to make science relevant for greater numbers of students. Yet another strategy to make science more appealing, and promising for meaningful learning, is to integrate new technologies (ICT) in the teaching.

In the CoReflect project (**www.coreflect.org**) – groups in Cyprus, England, Germany, Greece, Israel, Sweden and the Netherlands are developing, implementing and evaluating teaching sequences using the web-based platform STOCHASMOS (Kyza & Constantinou, 2007). The interactive web-based inquiry materials support collaborative and reflective work. The project methodology is based on the idea of design-based research. All learning environments are focusing "socio-scientific" questions. In the article we report from the implementation of the Swedish learning environment. The learning environment is focusing socio-scientific issues in an astrobiology context. Students are working with two driving questions. One of them: *Should we transform Mars into a planet where humans can live in the future*? is focused in this paper. This socio-scientific issue includes e.g. scientific aspects (Is it possible?, Different ways to proceed? etc), economical aspects (Resource priority?), social aspects (e.g. Safety? Who will go?), and ethical aspects (Is it alright to interfere in other planets? Hybris?). During their work with the learning environment the students collect and formulate arguments (for and against) concerning different aspects of the driving question, using a special template included in the workspace of the learning environment. Included in the web-based platform is also a chat function.

The aim of this article is to describe the kind of arguments used in the students' chat when discussing the driving question. The arguments used and discussed in the chat are related and compared to the arguments that have been formulated by the students during the teaching sequence, and are also compared to the arguments used in the students' final standpoints, written the lesson after the chat took place.

METHODS

The students working with the learning environment are in their last year of compulsory school (16 years old), and work together in small groups (2 or 3 students in each group). Each group worked in front of one computer. The chat reported from was the second to last lesson during the teaching sequence. The student groups were paired by the teacher. The oral discussions within each group while chatting with another student group, were audio taped. All computer activities were logged by STOCHASMOS. The arguments that the students have collected and written in the workspace of STOCHASMOS, as well as their final standpoints on the issue, are therefore available for the researchers. Also the chat is logged. In addition to this researchers were present in the classroom during the "chat lesson", observing the lesson and taking fieldnotes.

RESULTS

Working with the learning environment the student groups collect different kinds of arguments (scientific, economical, social, and ethical arguments). During the chat the students used these when discussing whether or not we should transform Mars. The teacher felt that the students would need some scaffolding to focus on relevant questions. She therefore provided some questions (aspects of the main question) that could be discussed during the chat. The students enjoyed the chat as a way to discuss the driving question. However, the discussions turned out in different ways. The preliminary results suggest that students frequently use science in their chat. Some groups do not use very many arguments (concerning different aspects of the issue) in the discussions, while others use a lot of different arguments. In the final standpoints, written the lesson after the chat, the students use arguments related to risks, costs & resources, curiosity, possible development and ethics. Much of this is related to science. In the presentation during the conference we will also present results concerning how the content and arguments used during the chat are related to the arguments that the students have formulated using the template "collected arguments" during the teaching sequence, as well as to the arguments used in the final standpoints.

CONCLUSIONS

Both the students and the teacher liked the chat. It was obvious that it was a familiar tool for the students. The teacher saw it as a good possibility for the students to develop their argumentation, and to practice formulating the arguments in written text. We saw that the students used different kinds of arguments in the chat, also arguments based on science are frequent. This results differ from other results that have found that science is not, at least not core science, considered relevant by the students when discussing and making decisions on socio-scientific issues (Aikenhead, 2006). However, we can also see that the discussions in the chat turn out in different ways for different group-pairs. Some chats cover different aspects of the issue, while others focus upon one or few aspects. The experience from the implementation of the learning environment suggests that including a chat activity have the possibility of making the students engage in the discussions, but also that some of the students found support in the scaffolding questions from the teacher.

SUBJECT MEETS SUBJECT: A STUDY ABOUT TEACHERS' INTERCHANGE IN EDUCATION FOR SUSTAINABLE DEVELOPMENT

Helen Hasslöf

School of Teacher Education
Malmö University, Sweden

helen.hasslof@mah.se

Margareta Ekborg

School of Teacher Education
Malmö University, Sweden

margareta.ekborg@mah.se

ABSTRACT: SUBJECT MEETS SUBJECT

The aim of this study is to investigate the significance of interdisciplinary meetings between teachers for the interdisciplinary interpretation of ESD. This study takes its point of departure at a literature seminar between seven teachers at an in-service course of ESD at Malmö University. What different aspects are emphasized and how do the teachers use each other's knowledge as resources? What do different teachers consider as important aspects of the discussion? The preliminary results show that the social aspects and questions with ethic and moral based entrances are dominating the discussion. The ecological perspectives are mostly treated as fact-based knowledge.

Keywords: *ESD, interdisciplinary, collaboration, ESD-content, science education*

INTRODUCTION

Environmental education has been a topic for biology teachers in Sweden, as well as in many other countries, since the 1970th. In order to meet the goals in policy and school documents about ESD, environmental education is supposed to broaden the view and embrace different aspects and competences. ESD seeks to integrate ecological, social and economic perspectives into environmental education. Studies emphasizes the necessity of the teacher's own ability to possess "holistic views", "complex thinking" and "pluralistic attitude", since these are important pieces of the pedagogical content knowledge (PCK) for ESD. To meet these claims teachers need a broad understanding of ESD.

Studies show that collaborative reflection can provide greater clarity to issues than can be individually perceived (Rearick & Feldman's, 1999). Learning in collaborative settings is particularly enhanced when people with different ideas, conceptions, and opinions interact. In collaboration, existing knowledge extend and new knowledge can be created (Putnam & Borko, 2000). However, interdisciplinary teaching is not free from problems. Several studies show the difficulties of interdisciplinary teaching in school. On the other hand when teaching for sustainable development in mono disciplinary subjects there is difficulties for the teachers from natural science to include aspects like values in science, and critical attitudes. Similarly teachers from the social science have problems to discuss environmental questions with the demand of natural science knowledge. Studies about lectures' beliefs and attitudes from higher education shows that teachers often place ESD equal to ecological sustainability (Summers & Childs, 2007). This indicates a lack of understanding how the ecological, economic and social aspects are intertwined in ESD. Though collaboration is considered a powerful professional development environment for teachers, little empirical research has been done into how teachers learn in collaborative settings.

METHODS

The study takes its point of departure at a literature seminar at an in-service course where teachers reflect on sustainable development together in an interdisciplinary setting. Due to Wertsch (1991) learning and meaning making are defined as processes taking place in social contexts, with the language as a main artefact. Learning is mediated through communication between individuals. In this study teachers reflect together in a social context with possibilities to use knowledge form each other. This is in line with the view of learning and development as a transition from a social context into individual understanding in social situations. While the conversation continues the communication makes sense for the participants. This study use a sociocultural perspective which means one ought to start investigating the ways in which people think by looking at how they *talk* and *communicate.*

Research questions

- What different aspects are emphasized by teachers in an interdisciplinary discussion about sustainable development, and how? Which role has the ecological perspective?
- How do the teachers use each other's knowledge as resources?
- What do different teachers consider as important aspects of the discussion?

The seminar group that was subject for this study consisted of seven teachers that normally work in public schools in Malmö with pupils age 13-15. The teachers represent different subjects: natural science, social science, language, mathematics and home economics. The literature seminar was videotaped and audio recorded, semi-structured interviews were used after the discussion. The transcripts from the seminar and the interviews are now the subject of analysis and the results will extend during this spring. A form of content analysis is used which play attention to what different dimensions of ESD that emerge and if there is a tendency to pick them up and treat them as intertwined. Bakhtines (1986) framework is used to analyse the conversation. The transcripts from the interviews will also be analysed in a qualitative content analysis.

RESULTS

Initial analyses reveal that the social aspects and questions with ethic and moral based entrances are dominating the discussion. The ecological perspectives are mostly treated as fact-based knowledge. This implies that the ecological questions is not as dominating as supposed in environmental discussions, on the other hand it seems like the lack of value oriented aspects in the natural sciences seems to be confirmed in those preliminary analyses. The teachers pick up each other's words and statements, to use for their own argumentation. Further analyses of those data are currently underway. The findings will be discussed in relation to the signification and goals of achieving an interdisciplinary approach of ESD.

CONCLUSIONS

For the international research field this study hopefully can give a complementary piece of understanding to the ESD research field, by illustrating the outcome of interchanges between teachers in relation to integration of the three dimensions of ecology, economy and social questions. Since the research about teachers' learning is not investigated to a great extent, this study could be a complement. The result/findings of this study might reveal a view of the importance of how teachers can develop a more complex understanding of ESD through reflection in a social interdisciplinary context. *To be revised and continued when the results and the analysis expand during this spring…*

PROBLEM BASED LEARNING (PBL) FROM THE PERSPECTIVE OF SOCIO-CULTURAL LEARNING THEORIES

Carola Hernández Hernández

Aalborg University/PhD Student

chernan@learning.aau.dk

ABSTRACT

The socio-cultural views of learning in science have led us to rethink the ways to learn and teach these areas in all educational levels. The problem-based learning (PBL) has been developing since the 70s as a proposal of situated learning in different universities. In particular, Aalborg University in Denmark has developed its own model of PBL. This paper aims to present an initial exploration of the PBL model in the faculty for Engineering, Science and Medicine at the Aalborg University, the principles on which it is based, and whether these can be consistent with socio-cultural views of learning or not.

Keywords: *Problem Based Learning (PBL), socio-cultural perspectives on science, science education at university level.*

INTRODUCTION

Leach and Scott (2003) argue that adopting a socio-cultural perspective on science education implies viewing science, science education, and research on science education as human social activities conducted within institutional and cultural frameworks. Radford (2008) shares this perspective and suggests a view of teaching and learning anchored in the idea that learning is a social activity (praxis cogitans), deeply rooted in historically constituted cultural forms of thinking and being. And they conclude that it means seeing the scientific study of the world itself as inseparable from the social organization of the scientists' activities. These ideas involve rethinking the ways of learning and teaching science at all educational levels, particularly at the university level.

In recent years, higher education has been an interesting field for research because the object of study is the institutional foundation of all academic disciplines and the contribution of systematic knowledge to the future of society. In the 70's some universities that developed their curricula on problem-based learning (PBL) as McMaster University (1969) in Canada, Aalborg University (1974) in Denmark or Maastricht University (1976) in the Netherlands became visible. These institutions have been closely watched because of their innovative curriculum and student-centred ways of teaching in many professional fields, such as medicine, engineering, science, or law.

Problem-based Learning is a pedagogic model consistent with a current philosophical view of human learning, which argues that knowledge is situated: it is part and product of the activity, context and culture that developed and used this knowledge (Barrows, 1996; Vygotsky, 1978, 1986). In the PBL model, students in small teams explore a problem situation, and through this exploration, they are expected to identify the gaps in their own knowledge and skills, so that they will decide what information they need to resolve or manage the situation with which they were presented (Barrows & Tamblyn, 1980). Thus, in this model the problems are used as the starting point to generate curiosity and motivation about the new knowledge; students assume responsibility for their own learning, and teachers change their role from instructor to facilitator (Barrows, 1996). This model contrasts with case-based learning where the problem is presented after the topic is covered to test the understanding and support synthesis (Savery & Duffy, 2001).

However, there are differences in how problem-based learning models are practiced and every university has its own way to implement it. There are some studies that argue that the McMaster model is consistent with socio-constructivism (Barrows & Tamblyn, 1980; Savery & Duffy, 2001). Thus, the Aalborg PBL model has not developed on the basis of a consistent compressive theoretical understanding. Instead, it has developed on the basis of a number of – often isolated - theoretical principles, which have found their way to a pragmatic development (Annette Kolmos, Flemming K. Fink, & Krogh, 2004). Therefore, the purpose of this paper is to explore whether these principles can be consistent with a socio-cultural view of learning.

METHODS

I conducted a literature review to characterize the PBL model developed at Aalborg University and to find out which are the underlying principles. In particular, I concentrate in the way that this model is understood in the faculty for Engineering, Science and Medicine to analyze their pedagogical assumptions. Finally, I try to find out if these principles can be consistent with the proposals from a socio-cultural view of learning.

RESULTS

The Aalborg PBL model is a combination of a problem-based learning (PBL) and project-organized approach (POL). In particular, in the faculty for Engineering, Science and Medicine the learning of process competences is considerably supported by the PBL-POL. These competences cannot be acquired only through mental processes. They involve other abilities and they represent a meta-cognitive level of both action and knowledge. Kolmos, Fink and Krogh (2004) show that the PBL class is organized in groups where the students: analyze and define problems within an interdisciplinary subject frame, develop a project during the semester, work together on their project, and submit a common project report. However, they are evaluated individually. The group formulates the problem in the project but there is always a supervisor who approves it. This brief overview makes it clear that there are three theoretical dimensions underlying this model: the problem, the content and the team. Once these three elements are identified, I try to show some of the reasons why they are consistent with a socio-cultural view of learning.

The first element, the problem, is the basis to develop motivation and it determines the direction of the learning processes. Nevertheless, a problem only exists in a social context and it expresses contrasts or conflicts in a specific culture or view of the world. For example, Leach and Scott (2003) show that the development of scientific knowledge (which involves the resolution of the problems and generating new ones) is not only constrained by empirical data, but it is also socially validated by the scientific community. The second element, the content, takes a different approach: it is especially concerned with interdisciplinary learning and exemplary practice. This view enables a direct relationship between theory and practice because the learning process involves an analytical approach using theory in the analysis of problems and problem solving methods. In a socio-cultural view of learning, the learning occurs while the subject participates in socially structured practices and appropriates them (Radford, 2008). And finally, most of the learning processes take place in groups or teams where students discuss, negotiate and learn from their project and in their project permanently. According to socio-cultural theory, dialogue in a learning setting plays an important part in helping learners to *internalisation* ideas and knowledge from the social plane (Vygotsky, 1986).

CONCLUSIONS

A first exploration of the PBL-POL model of Aalborg University suggests that the pedagogical principles on which it is based are consistent with socio-cultural views of learning. In particular, on the faculty for Engineering, Science and Medicine the development of process competences is the core of helping the students to be able to work as a part in a project-working environment. In this sense, the model PBL-POL introduces and supports students in the appropriation of the language and culture of their professions.

A STUDY OF YOUNG CHILDREN'S COGNITION OF SPACE

Wen-Tung Hung

Meiho Institute of Technology,Department of Nursing

x00000023@meiho.edu.tw

ABSTRACT

The aim of this study was to explore young children's conceptions of space. We analyzed the concept of space in teaching materials, integrated the experts' concepts and developed a map of space and six science activities. We observed and recorded the children's performance through the science activities, and then interviewed eight children individually to confirm their cognitive performance. The major findings were: 1. The concept of space in current teaching materials focuses a great deal on direction, plane, and dimensions, but lacks teaching logical thinking, body motion and time. 2. Young children's linguistic language abilities have major effects on their cognitive performance. 3. Young children perceive special concepts through sight and different sensations result in different judgments.

Key words: *early childhood, individual interview, science activities, concept of space*

INTRODUCTION

The spatial concept is integrated into the curriculum of general knowledge in Taiwan. This general knowledge includes 1. The comparisons of numbers, quantity, and shapes. For example: big vs. small, much/many vs. little/few, long vs. short, light vs. heavy, thick vs. thin, and high vs. low. 2. Knowing basic shapes. For instance: square, triangle, rectangle, circle, etc. 3. Positions, such as top vs. bottom, in front vs. behind, or front vs. back, and left, middle vs. left.

According to Hung (2007), a child under normal cognitive development could discriminate the ideas of top vs. bottom at the age of three, in front vs. behind at the age of four, and left vs. right at the age of five or above. A six-year-old child was capable of viewing space and position as a constant whole. Chen (2005) demonstrated that the conception of space was an essential cornerstone for learning geometry and that the perfect time for children to learn cognitive space was in the phase of early childhood.

METHODS

This study was conducted with judgmental sampling. 66 participants were recruited for the study from a preschool in Kaohsiung City, Taiwan. Researchers recorded the children's spatial concepts by observing them playing freely. Of the sample of participants, 8 children were interviewed. Free play science activities, including direction, plane, dimensions, logical thinking, body motion, and time were created to explore young children's spatial concepts.

RESULTS

A. Direction:

Nearly 80% of the children were correct in the concept of inside vs. outside; as to top vs. bottom; approximately 55% were correct. However, only 44% were right in the concept of in front vs. behind.

B. Plane

About 94% children identified circles and triangles correctly, but were confused with rectangles and squares, where just 73% of the children expressed the right answer. In demonstrating a figure with their hands, 74% children performed better demonstrating a circle, 29% could perform well showing a square with their hands, 44% had correct responses about a rectangle, and about 38% were more accurate with a triangle.

C. Dimensions

Nearly 76% of the children could understand the concepts well regarding space and high vs. low and could perform demonstrating the shapes with their bodies.

D. Logical thinking

Almost 36% of the children were able to present the order from big to small and vise versa, while 32% were subject to partial mistakes.

E. Body motion & Time

Approximately 85% of the children could predict the speed of the ball accurately. It is clear that most children have the ability to sense speed correctly, while 40% could succeed in the first time in rolling a ball, 25% succeeded the second time, 10% succeeded on the third attempt, yet the remaining 25% failed.

CONCLUSIONS

The teaching materials for kindergarteners today concentrate on size and direction, but have less emphasis on position. As to geometry, the materials emphasize plane geometry: for instance, plane shape, one dimension and two dimensions. This study suggests promoting children’s spatial cognition and development with the manipulation of three-dimensional items.

NEGOTIATING LIFESTYLES? HOW PRIMARY SCHOOL STUDENTS DISCUSS THEIR IMPACT ON GLOBAL WARMING

Malin Ideland

School of Teacher Education, Malmö University, Sweden

malin.ideland@mah.se

Claes Malmberg

School of Teacher Education, Malmö University, Sweden

claes.malmberg@mah.se

ABSTRACT

Researchers claim that school has failed to empower children as citizens of the future. To develop a new approach for planning educational practices we need to bring in the students' diverse backgrounds in classroom discussions. But in what ways is this possible to do? The aim of this paper is to analyse how children from different socio-cultural contexts bring in their interests, experiences and knowledge in discussions about climate change and reduction of CO2.

The data come from a study in which >100 students have discussed global warming from an everyday perspective in focus-groups is used. Five schools, situated in districts with different socio-economic status in the city of Malmö, Sweden have been involved in the study.

Two different themes stand out as important for the students' discussions; a) effective ways to lower carbon dioxide emission; b) consequences for the students themselves and their families. The discussions reveal that children's way to reason in controversial issues are related to their everyday life, they are trying to legitimate their own habits at the same time as they discussing possible sacrifices. Their different living conditions are mirrored in the way they consider the problem, but also in their way of discussing.

Keywords: *Primary science, global warming, socioeconomic status*

INTRODUCTION

There is an increasing emphasis on educating young children to citizens of a global society (Dillon & Osbourne, 2007). However, despite the rhetoric, many researchers claim that school has failed to empower children as citizens of the future (eg Aikenhead, 2006; Claxton, 2008) and to help them to develop knowledge and skills that would be relevant for their living conditions (Hedegaard & Chaiklin, 2005). Among possible reasons for this are teachers' lacks of confidence when dealing with controversial issues, conflicts of interest and in young children's abilities to discuss (Driver et al, 2000, Oulton, et al. 2004). On the other hand, research suggests that school science to a higher extent should take departure from complex, authentic cases involving conflicts of interest – socio-scientific issues (Jensen & Schnack, 2006; Ratcliffe & Grace, 2003). Research also points out the importance of social learning in form of collaborative meaning-making (eg Mercer et al, 2004).

The aim of this paper is to analyse how children from different socio-cultural contexts bring in their interests, experiences and knowledge in discussions about climate change and reduction of CO2.

METHODS

The paper will present data from a study, in which 10 years old primary school students have discussed global warming from an everyday perspective in focus-groups. Five classes have been involved in the study. The schools are situated in Malmö in districts with different socio-economic status. The research interest is on how 10 year old students from different socio-cultural contexts discuss complex issues and how they make connections between a school task concerning global warming, their own interests and societal interests.

The classes were divided in groups of four students. The group task was to choose two among four different suggestions on how to lower carbon-dioxide emission. This followed by writing a letter to the Swedish Minister for Environment involving their suggestions. The students made also a drawing of either a problem with or a possible solution of the global warming issue. All discussions were audio-taped, transcribed and analysed from a discourse psychology-perspective, e.g. how the children make use of different interpretative repertoires – culturally available sets of statements (Wetherell and Potter, 1987) when legitimating their own behavior at the same time as they make personal sacrifices.

RESULTS

Two different themes stand out as important in the students' discussions; a) knowledge about effective ways to lower carbon dioxide emission; b) consequences for the students themselves and their families. The discussions reveal that children's way to reason in controversial issues are related to their everyday life. Their different living conditions and socio-economic status are mirrored in the way they consider the problem. When they negotiate with themselves and reflect over how much they are willing to sacrifice they often try to legitimate their own way of living by bringing in arguments which support their own way of living. We can also see how their socio-cultural contexts are reflected in their way of discussing. Ethnic Swedish children from an academic middle class seem to be more used to discuss and argue than children from a foreign ethnic background and a low socio-economic status.

CONCLUSIONS

By discussing "real world problems" in terms of personal sacrifices and societal consequences the complex issues become possible to deal with for both teachers and students. What is learned has a value outside school. We claim that through bringing in authentic cases, and letting the students negotiate their different perspectives, the school might have a possibility to mentally prepare the students to take action in the future. Wood (1998) suggests that in order for children to be empowered and participate in making choices, they need to practice making decisions through the curriculum. This project is investigating the barriers and affordances for productive student talk in primary classrooms when handling complex socio-scientific issues.

SHOULD THE INTELLECT, EMOTION AND PERSONAL BELIEFS OF LIFE SCIENCES STUDENT TEACHERS BE EXPLORED AND CHALLENGED?

Angela James

University of KwaZulu-Natal

jamesa1@ukzn.ac.za

ABSTRACT

This paper presents a theoretical argument for teacher professional development that takes heed of the holistic development of student teachers. During their professional development student teacher's intellect, emotion and personal beliefs are explored, recognised, challenged and developed. This is possible if teacher professional development focuses on a paradigm shift in the thinking and actions of student teachers, construction of theory, authentic learning and reflective practice. Student teachers can then be expected to be facilitators of learning who can work with diverse cultural, racial and social groups of learners.

Keywords: *professional development, facilitation, learning, student teachers*.

INTRODUCTION

In South Africa, national educational concerns have identified a poor education system for poor education quality. This poor education is due to in many instances to "poor quality teaching (Paton, 2006, p. 1). Moreover, according to Soudien (2007, p. 188) it is also concerned with "the impact it [the country] is making on the *quality* of the learning". Morrow (2007, p. 184) is of the opinion that "we urgently need to improve the quality of teaching and learning in our schooling system".

A particular action that can be taken to address these issues is to develop a teacher education programme that focuses on the holistic development of student teachers. This programme should aim for student teachers to achieve the highest possible quality of professional practice. It is within this programme that the professionalism required of student teachers to be holistically developed, This is possible if their intellect, emotion and personal beliefs are explored and recognised, and then challenged and developed.

In South Africa our education is in dire need of serious transformation. This transformation is necessary as the results of two major international research studies, namely: the performance of Grade 8 learners in the Trends in International Mathematics and Science Study (TIMMS) of 1995, 1999 and 2003 (Howie, 2001, 2004; Reddy, 2006) and Grade 4 learners' performance in the Progress in International Reading Literacy Study (PIRLS) in 2006 (Mullis, Martin, Kennedy and Foy, 2007), where South African learners had the lowest scores amongst 40 and 50 countries, respectively. This transformation and renewal of education should "start and end with the teacher" (Morrow, 2007, p. 209). Teachers remain the crucial interface between education policy that demand quality education and the execution of this quality (Fullan, 1982). Hargreaves (2003, p. 136) suggests that changes required from policies (or any other relevant authority for that matter) "should be inherent in teacher professional development." In addition, the quality of teacher education itself has to emulate the quality education expected from teachers as a trademark of its professional development.

An approach to teacher professionalism could focus on student teachers constructing their own knowledge about how to teach through the notion of phronesis which Kessels and Korthagen (2001, p. 27) define as “perceptual knowledge, the practical wisdom based on the perception of a situation”. Essentially, for student teachers to be able to construct a phronesis of facilitating learning of school learners, they would need to experience facilitating learning. This construction of theory would have to be a personal activity as each individual’s conceptual structures are not the same (Von Glaserfeld, 2001). Since each student teacher is not given a recipe on how to facilitate learning by an external other, he/she is expected to construct it. In constructing a phronesis of facilitating learning, each student teacher is expected to use his/her experiences of teaching and learning and, most importantly, to integrate these with educational theory. The challenge therefore is for us to respond to how student teachers construct this theory.

Student teachers could construct this theory if they experience authentic learning, which is concerned with experiential, active, professional and contingency learning (James, 2009). The focus of this learning is on student teachers learning in real-life contexts and situations where they are expected to construct a phronesis of facilitating learning in practice. This can only occur if they “use the real world as [their] classroom” (Dryden & Vos, 1999, p. 26) to facilitate learning.

The provision of authentic learning is a requirement for the student teachers construction of a phronesis of facilitating learning but it does not presuppose that they will do this. A factor that could impede this process is the student teachers’ “own preconceptions about learning and teaching.” (Korthagen, 2001, p. 255).

This paper addresses these issues and makes suggestions about what is possible in the South African context and the implications of this for improved quality of education. Since teachers are exposed to diverse learners and teaching contexts, changing curricular and new subject content, it is necessary for student teachers to be professionally developed to work with these changing dynamics.

ABSTRACT

We currently live in the threshold of the most important scientific, technological and industrial revolution in the development of mankind. The future belongs to those who are able to connect the knowledge on the most advanced technologies with the best practice, strategic management, business and marketing skills. To provide the necessary skills in this area, it is appropriate that a field of teaching and research that one may call management of technology (MOT) is developed. Therefore a real challenge for academia, government and industry is: how to provide industry with the youth educated managers that will develop and carry out the future manufacturing strategies.

Keywords: *technology, management, knowledge, academic program, evaluation.*

INTRODUCTION

Technology is the driving factor which is the cause of biggest changes in our everyday life. Technology is also one of the key means companies use to remain competitive, be included in the labor market, keep contact with their customers and form enlarged partnerships (Hancock et al. 2002; Schilling 2005; Janeš and Dolinšek 2009).To provide the necessary skill base in this area, it is appropriate that a field of MOT is developed (Dolinšek 2004b). Apart from managing innovation processes at research and development, it includes also the introduction and the management of new technologies, products, production processes and other related functions in the company (Tidd et al. 2001). It refers to daily operative activities and strategic questions (NRC 1987). That is why MOT is a demanding and wide discipline which includes the interdisciplinary knowledge of technologies and management. Managers, facing technological challenges daily, must be able to respond promptly and adequately, which requires new knowledge and brings about new tasks. Basic processes of MOT or the tasks of technology manager are: identification, selection, acquisition,use and protection of technology (Khalil 2000).

MOT AS AN INTERDISCIPLINARY FIELD OF STUDY AND RESEARCH

Most comprehensive review of research and academic programs of MOT was done by the IAMOT (International Association for Management of Technology). The census included analysis of 148 international academic programs on MOT and it concludes that the titles and the content of these programs vary significantly (Kocaoglu et al. 2003). Given this diversity, an initiative was launched in 2001 to find common ground for MOT and to establish the credibility of the discipline. Numerous international organizations (i.e. IAMOT, Technology Management Education Association, et al.) participated in this debate. A Credo for MOT (2004) was produced. In accordance with this proposal, MOT academic program should have three components (Van Wyk 2004): accepted range of management specialties, knowledge of technology itself and of technology related management procedures and the contextual setting of MOT. MOT academic programs address technology at an operational, at a strategic and at a policy level (Nelson 1995).

MOT ACADEMIC PROGRAMS IN SLOVENIA

In Slovenia, MOT topics are currently being taught only as a subject or part of the discipline within other study programs (i.e. International Postgraduate School at Institute Jožef Stefan,et al.). On 17 March 2006, the HE council of Slovenia gave its approval to the proposed 2nd level program of the University of Primorska Faculty of Management Koper (UP FM). With this, UP FM is the first HEI in Slovenia that has obtained also accreditation for implementing the MOT program according to the Bologna model. Student acquires general managerial knowledge and that specialized knowledge which enables him to successfully master technology. Postgraduate program MOT is designed for the continuation of undergraduate studies (Dolinšek 2004a).

METHODOLOGY

Students who participated into the survey were from undergraduate program and participants of the (UP FM) MOT course. The questionnaire was developed for the purpose of research the perception of the students and monitoring the development of MOT course. Main research question is what is the added value of MOT course (students satisfaction) seen from the students' viewpoint? Questionnaire was divided into four sections: course organization, course contents, course study materials and students estimation of lecturers. Some questions were open and some questions were consisted of a five point scale from 1 (poor) to 5 (excellent). Answers were analyzed quantitatively with the factor analysis method. Survey was performed in the 2006/07 academic year.

EMPIRICAL FINDINGS

For development and improvement of the MOT course we performed survey which we conducted in three study centers of the FM i.e. Nova Gorica, Škofja Loka and Koper (SCNG, SCŠL and SCKP). The results are shown in the table 1 below.

Table 1. Factor models and reliability by Study Centre's

Study Centre	P.Corr.	KMO	Sig.	Comm.	%Var.	Factor	Reliab.	N
Organization	-	0,794	0,000	>0,45	74,202	Org.satisf.	0,882	31
Contents	-	0,840	0,000	>0,48	73,635	Con.satisf.	0,907	31
Study Material	-	0,828	0,000	>0,6	70,310	SM.satisf.	0,888	31
SCNG Sum	good	0,790	0,000	>0,6	61,744	overall satisf.	0,950	31
Organization	-	0,776	0,000	>0,45	68,308	Org.satisf.	0,842	24
Contents	-	0,710	0,000	>0,6	68,829	Con.satisf.	0,883	24
Study Material	-	0,880	0,000	>0,5	77,894	SM.satisf.	0,926	24
SCŠL Sum	good	0,621	0,000	>0,8	59,712	overall satisf.	0,946	24
Organization	-	0,481	0,049	>0,5	67,585	Org.satisf.	0,800	7
Contents	-	-		-	-	-	0,143	7
Study Material	-	-		-	-	-	0,462	7
SCKP Sum	low					-	0,692	7

Note: Used Extraction method was Principal Axis factoring or Maximum likelihood.

Main picture consisted from the factor analysis result is the confirmation of the successful harmonization of MOT course with the principles of the MOT Academic Program suggested by Credo for MOT (2004). Factors from analyses confirmed the satisfaction of students with the course organization, contents and study materials (see table1).

CONCLUSION

The fact is that the pace of technological development is so extensive that theoretical and professional knowledge is fast becoming obsolete. Quite obviously, technological development and globalization has a huge influence on the requirements of the economy to have a different kind of graduates, which cannot be provided by avoiding MOT. Therefore a real challenge for academia, government and industry is: how to provide industry with the human capital that will develop the future manufacturing and service strategies. To do that, universities need to develop a new generation of manufacturing curriculum with professors, who understand the future industry and the need to attract youth with an interest in technology.

NORWEGIAN TERTIARY STUDENTS' VALUES AND PRIORITIES FOR EDUCATION AND FUTURE JOB: GENDER DIFFERENCES AND IMPLICATIONS FOR RECRUITMENT

Fredrik Jensen

Norwegian Centre for Science Education

fredrik.jensen@naturfagsenteret.no

Camilla Schreiner

Norwegian Centre for Science Education

camilla.schreiner@naturfagsenteret.no

ABSTRACT

Results from the research project "Vilje-con-valg" indicate that all Norwegian tertiary students have in common that they want to do something interesting, meaningful, self-realizing and self-developing in their education and future job. They also want safe jobs and a good salary. To a larger extent than boys, girls want the education to be adjusted to their own skill level and they want personal guidance from their teachers or supervisors. Girls have less confidence in their own abilities to succeed in science, technology, engineering and mathematics (STEM) subjects, which might be an important factor keeping girls out of science and technology education. They also put emphasis on meaning, idealism, helping other people and benefiting the society in their future jobs. It may be suggested that recruitment initatives should make it visible that STEM disciplines fit with the values and priorites of today's youth. Initiatives should show that these disciplines offer interesting, meaningful and self realizing career options, and safe jobs and reliable income. Efforts directed at girls should show them that they can do something meaningful and idealistic through a career in STEM. It could also be fruitful to develop more long-term initatives aimed at enhancing girls' expectation of success.

Keywords: *Recruitment, tertiary education, gender*

BACKGROUND AND AIMS

In Norway and other countries in the Western world there is a lack of students in science, technology, engineering and mathematics (STEM) disciplines (EU, 2004). In order to develop successful recruitment initatives, knowledge of adolescents' priorities and wishes for education and future job is valuable. This presentation is based on the Norwegian research project "Vilje-con-valg", which aims to describe young Norwegians' values, wishes, prioritities and aspirations related to their career choices.

Students' values, priorities and wishes for education and future job will be looked at by comparing responses across different disciplines, in order to see what they have in common and how they differ. Focus will also be given to differences and similarities between girls and boys. Finally, implications for future efforts at recruiting more people into STEM disciplines will be discussed.

DATA SAMPLE, METHOD AND THEORY

Vilje-con-valg survey data was collected fall 2008. The target population is first term students in tertiary education on STEM subjects, and students from some non-STEM subjects for comparison. This presentation focus on the students responses on questions in the questionnaire such as: How important are the following for your future job?, which has a list of items the students answer by ticking off on a four level Likert scale from “not important” (coded with value 1) to “very important” (coded 4). The mean scores are compared across ten different disciplines: marine technology (bachelor’s and master’s programme), engineering, graduate engineering, biology, science and mathematics, nursing, veterinary, media and also economy and business administration. All presented results are statistically significant and interpreted as interesting.

The findings from Vilje-con-valg will be discussed in light of Inglehart (1990, 1997), who describes our society as post-materialistic. He finds that values such as democracy, justice, environment, and creativity are more important to youth of today than traditional values such as earning money and accumulating goods.

RESULTS

All students, regardless of discipline, reported they wanted to do something interesting, meaningful, self-realizing and self-developing in their education and future job. For these items the mean scores are 3,0 and above. Students from all disciplines, both STEM and non-STEM, also put some emphasis on safe jobs and a good salary, with mean scores around 2,7 on these items.

To a larger extent than the boys, girls want the education to be adjusted to their own skill level and they want personal guidance from their teachers or supervisors. Girls have less confidence in their own abilities to succeed in the education they have started on. Girls’ low expectation of success are also documented in other studies (for example Kjærnsli, Lie, Olsen & Roe, 2007; Simpkins, Davis-Kean & Eccles, 2006). To a larger extent than boys, girls put emphasis on meaning, idealism, helping other people and benefiting the society in their future jobs.

DISCUSSION AND POSSIBLE IMPLICATIONS FOR FUTURE RECRUITMENT INITIATIVES

It may be suggested that recruitment initatives should make it visible that STEM disciplines fit with the values and priorites of today’s young people. The initiatives should show that STEM offer interesting, meaningful and self realizing career options. At the same time it might be fruitful to emphasise that such careers offer safe jobs and a reliable income.

Inglehart claims that today’s adolescents are more focused on non-materialistic values such as creativity, self-development and the environment than earlier generations. The results above support this, but traditional values, such as earning money and safe jobs, are also important for the students.

Girls are an important target group for recruitment to STEM, as they make up a relatively small proportion of today’s STEM population. Recruitment efforts should speak to the girls’ interests and concerns as much as to boys’ interests and values. Efforts directed at girls should show them that they can do something meaningful and idealistic through a career in

STEM fields. Girls' self confidence in STEM subjects are lower than boys', and this might be an important factor keeping girls out of science and technology subjects. Therefore it could be fruitful to develop more long-term initatives aimed at enhancing girl's expectation of success.

ABSTRACT

In science education scientific concepts and phenomena are introduced that can be difficult for students to understand or talk about. In this study the ultimate learning goal about how friction facilitates or restricts movement is introduced by the teacher through more proximate goals. We have studied two such proximate goals used by the teacher: 1) why cars have tyres and 2) that a vehicle can continue to travel indefinitely if there is no resistance at all. The events in the classroom were filmed and transcribed and as a method for analysis practical epistemology analysis (PEA) was used. The study shows how both the students and the teacher mainly remember experiences on the basis of the more proximate goals rather than from more ultimate scientific learning goals. Further there is no continuity created through teaching that aid remembering in a way that explicitly connect the more proximate goals to each other or to the more ultimate scientific goal. We discuss how teachers' may create continuity between these different goals.

Keywords: *inquiry, science, learning, continuity*

INTRODUCTION

One important task for science education is to introduce new scientific concepts and make their relationship to observable phenomena evident, e.g. understanding how friction affects movement. As such a goal is rather difficult for students to understand and to talk about before the concepts are fully comprehended (which is the goal), it is usual that the dialogue in the classroom starts from more proximate goals (*ends in view* in Dewey's parlance), e.g. why cars have tyres. These proximate goals make sense to the students by giving them a goal to which they can relate their experiences of phenomena, although they could still find it difficult to connect the proximate goals to the scientific ultimate learning goal. According to Dewey (1938/1997) it is the ends in view that became crucial for the students' progression of learning, rather than the ultimate scientific ends. Therefore it is crucial how proximate and ultimate goals can be given continuity together with the students in their activities. In this study we compare proximate and ultimate goals and the extent to which they connect to each other through what is remembered during class based on the proximate and ultimate goals. Many researchers have studied conceptual understanding (e.g. Osborn,1984; Duit & Treagust, 2003; Novak, 1998), whereas other researcher have studied the role of context, for what students remember, and thus can learn (e.g. Säljö and Wyndhamn,1993; Schoultz, Säljö and Wyndhamn, 2001). Here we bridge these studies by examining how continuity between proximate and ultimate goals is needed in helping students to remember relevant events based on the proximate goals.

METHOD AND ANALYSIS

This study considers teaching movement and friction in physics through an inquiry-based approach. Movement and friction is a standard unit for late elementary school in Sweden. The study describes a discussion between a Year 5 school class and their teacher. The starting point is an inquiry by the students on how the movements of a toy vehicle change when it is rebuilt so that the friction increases or decreases. Focus is on two proximate goals, why cars have tyres and if a vehicle can continue to travel indefinitely if there is no resistance at all. Both of these goals are subordinated an ultimate goal that the students should learn about how friction facilitates or restricts movement. The events that took place in the classroom were recorded with two video cameras and have been transcribed. Like Wickman and Östman (2002) we in this analysis coded utterances by the teacher and the students in order to see how they where related to proximate and ultimate goals and how they where made continuous through using certain words and the experiences related to.

RESULTS

The classroom discussion takes its starting point from the experiments, and the discussions dealt with what the student and teacher remembered as relevant events and observations and ways to talk based on the goals. We have studied two situations which followed upon each other the same afternoon. First they treated proximate goal 1, why the students thought cars have tyres, and second proximate goal 2, if a vehicle can continue to travel indefinitely if there is no resistance at all. In treating goal 1, the students' experiences are made salient and they have ample opportunity to use their everyday language in a direct and understandable way. The study shows that the conversation mainly serves the proximate goal of discussing why cars have tyres from two perspectives, first because they make it possible for the car to move ("we wouldn't get anywhere"), and because without them the rim or the roads would be broken ("there would be big holes in the road"). In this discussion the proximate goal is not related to the ultimate one. In the discussion dealing with proximate goal 2, instead the teacher's experience is of central importance. This is evident from teacher statements like "if there wasn't any resistance at all, air resistance like you have felt with the car and no resistance on the road or in any of these parts, then these vehicles, when they are pushed, would continue indefinitely". The students' experiences mainly serve as counterexamples to the teacher's statement. Students for instance object "What if it is an uphill, then?". The study also shows that the conversation mainly serves the proximate goal of discussing if a vehicle can continue to travel indefinitely if there is no resistance at all. The proximate goal is not related to the ultimate scientific goal, which is evident in that the students' and teacher's experiences and use of language do not refer to the ultimate goal of friction facilitating or restricting movement. Again there is a lack of continuity of explicitly discussing the relation between the more proximate and ultimate goals.

CONCLUSIONS

The conversations in the study mainly serve the proximate goal, whereas the ultimate scientific goal does not become known to the students. There is also a lack of continuity of explicitly relating the more proximate goals to each other and to the more ultimate scientific goal. The study also shows that an important part of teaching involves helping the participants to remember relevant events based on the proximate and ultimate goals and how this influences what the students are offered in terms of learning. This highlights the importance of teachers to continually help students create relation between the different goals. We argue that this is one of the teachers' most important tasks.

ABSTRACT

Believing that a positive change in teaching will result in positive changes in socio-cultural and human values, therefore it will make educational administrators responsible to supervise teachers toward effective use of teaching methods. This article encourages more student-centered teaching and shows how it is used in a course of supervision in educational administration at the graduate level for understanding the concepts of one chapter "Teaching & Leadership" in one session in a way that instructional and nurturing effects on students' socio-cultural & human values will be considered. Data gathered and analyzed statistically through using 72 Behrangi's indicators of effective instruction.

Keywords: *instructional impact, values in teaching leadership, graduate course of supervision.*

INTRODUCTION

Shouldn't it be the main goal of each education to create and improve human values and ethics in students? What would be the use of science in improving quality of life if love and respect, peace or trust is not used in teaching?

Today's education needs to be moved away from the 'chalk and talk' philosophy of previous generations. Educational administration should take into account socio-cultural and human values in teaching/learning process.

Students come from different family backgrounds, economical situations and cultural levels. It's vital for every teacher to know these diversities so that he/she can interact properly with each student. An effective approach to learning leads to quality learning outcomes. While teaching and learning should be inseparable, the teacher conducts the learning process. Therefore, the teacher should use appropriate teaching strategies to encourage students to use deep level approaches to learning. This article discusses how effective learning will have positive impact on socio-cultural and human values including students' self esteem, ability, achievement, knowledge, eagerness to learn, creativity, attitude, awareness, bravery, communication, competition, cooperation, confidence, control, curiosity, independency, emotion...

A brief explanation on the stages of our scenario for teaching one chapter of supervision course "Professional Knowledge about Teaching & Leadership" will make our intention more clear:

The actual teaching starts with a question, one which draws all attention to a specific subject which is the main concern of that session's teaching. There are also pictures conveying the same meaning all around the class. One of the two instructors, then, illustrates the chapter's map so that every student will get a general picture of what he will go through by the end of the class. The instructor also gives a general explanation on the subject and the methods she chooses to teach each part of the map. A scenario was designed using "Instructional Variables" and the steps of using role playing model of teaching with the help of another instructor.

During the play all students are required to pay extra attention to the subjects and write down the key words/phrases. After the play each student is requested to consult the result of his/her understanding with the student sitting next to him/her. Then they will consult it in groups of 3-5 depending on the total class population. Now a representative of each group comes to the front of the class to write down his/her group's findings. Each group representative also explains what he/she understands from the play. Students will discuss important issues together and clarifications will be made if required by the teacher.

Now another instructor starts another section of the map "Variables of Classroom Teaching", he has prepared flashcards including main explanation on each topic; he has also made a picture conveying the concept he is going to transfer. Dividing the class into groups of 3-5, the instructor gives each group some pictures along with some flashcards, he then asks them to find the suitable picture for each flashcard. Each group's representative then comes to the whiteboard to attach the pictures and related flashcards to the board and explains what he/she understands. Students will discuss important issues concerning the subject and the instructor will guide them in the right direction if required. In each part of the training/learning process socio-cultural and human values were getting into practice. We worked on students' dignity, creativity, self-esteem, confidence, memory, cooperation, fears, feelings, forgetfulness, freedom, growth, hope, intelligence and many other aspects altogether.

METHODS

At the end of the session a 45 item questionnaire on the basis of Behrangi's accredited questionnaire containing 72 evaluation indicators distributed among 27 students asking them to compare the present teaching method with the traditional methods in order to understand the impact of each method on socio-cultural and human values. The data has been analyzed using Veil nonparametric and Wilcoxon Ranks Test and we achieve the following results.

RESULTS

NPar Tests-Descriptive Statistics
Table 1

	N	Mean	Std. Deviation	Minimum	Maximum
sumscorerppw	27	204.44	12.786	170	221
sumscorelecture	27	67.41	17.485	30	116

Wilcoxon Signed Ranks Test
Ranks
Table 2

	N	Mean Rank	Sum of Ranks
Negative Ranks	27(a)	14.00	378.00
Positive Ranks	0(b)	.00	.00
Ties	0(c)		
Total	27		

a sumscorelecture < sumscorerppw
b sumscorelecture > sumscorerppw
c sumscorelecture = sumscorerppw

Test Statistics(b)
Table 3

	sumscorelecture - sumscorerppw
Z	-4.543(a)
Asymp. Sig. (2-tailed)	.000

a Based on positive ranks.
b Wilcoxon Signed Ranks Test

CONCLUSIONS

Considering the sequential data for each sample, the total score for each teaching method was calculated then through using veil dependant nonparametric test and Wilcoxon signed Ranks Test with 99 percent assurance level, z was calculated as 4.543 which shows there is a meaningful difference between two methods of teaching and that students gain much more on socio-cultural and human values through role playing & picture-concept models of teaching.

ABSTRACT

The purpose of this study was to determine Turkish pre-service science teachers' motivation toward environment. The data were obtained through Turkish version of Motivation toward Environment Scale (MTES). A total of 134 pre-service science teachers participated in the study. Descriptive results of the MTES revealed that the highest mean score was obtained on identified regulation sub-scale. This finding suggested that Turkish pre-service science teachers tend to do pro-environmental behaviors for mainly personal reasons. However, the lowest mean score on the external regulation implied that Turkish pre-service science teachers are less likely to show environmental behaviors for extrinsic reasons.

Keywords: *Motivation toward environment, self determination theory, pre-service science teachers*

BACKGROUND, FRAMEWORK AND PURPOSE

Many theoretical frameworks have been developed to explain the discrepancies among people's environmental knowledge, environmental awareness and pro-environmental behaviors. However, no definite explanations have been developed (Kollymus & Agyeman, 2002). While some studies revealed a significant relationship between environmental attitudes and behaviour (Arbuthnot,1977), there are studies demonstrating that there is no relationship between environmental attitude and behavior (Gill, Crosby, & Taylor, 1986). Even if people claim to have pro-environmental attitudes, they rarely act in terms of those attitudes (Pelletier, Tuson, Green-Demers, Noels and Beaton, 1998). Therefore, it is suggested that individuals should have a drive toward behaviour change for environmental issues. Self determined theory (SDT) is a theory which emphasizes this drive and environmental motivation. According to the theory**,** people who have self determined motivation toward environment sustain the behaviors in a long term basis while people externally reinforced quits the behavior when external force is absent for a long time (Pelletier, 2002). This theory was supported in many different domains. In the environmental domain, an instrument namely Motivation toward Environment Scale (MTES) was developed by Pelletier, et.al (1998) to asses individuals' motivation toward environment based on the SDT. The purpose of this study is to determine Turkish pre-service science teachers' motivation toward environment using the MTES.

METHODS

In this study, Turkish version of the MTES was used to assess Turkish pre-service science teachers' motivation toward environment. During its validation for Turkish sample, the MTES was administered to 134 pre-service science teachers in two large public universities located in Ankara, Turkey. The scale consists of 27 items in 6 subscales: intrinsic motivation, identified regulation, integrated regulation, introjected regulation, external regulation and amotivation. In order to validate the six-factor structure, confirmatory factor analyses (CFA) were conducted and croanbach's alpha coefficients were calculated as measures of reliability. Then, Turkish pre-service science teachers' motivation toward environment was examined through descriptive statistics.

RESULTS

The CFA results showed that, Turkish version of the MTES has six-factor structure. Each factor had satisfactory internal consistency. The overall reliability of the scale was calculated as 0.82. The mean score on the whole instrument was 4.51 with a standard deviation of 0.64. Examination of the mean scores for each sub-scale revealed that students exhibit environmental behaviors for different reasons. The highest mean score on identified regulation sub-scale (M=6.06) demonstrated that Turkish pre-service science teachers tend to do such behaviors for mainly personal reasons. However, the lowest mean score on the external regulation (M=2.18) implied that Turkish pre-service science teachers are less likely to show environmental behaviors for extrinsic reasons such as obtaining rewards.

Table 1. Means and Standard Deviations of the MTES Subscales

	M	SD
Intrinsic motivation	5.40	1.17
Integrated regulation	5.30	1.20
Identified regulation	6.06	0.96
Introjected regulation	5.46	1.21
External regulation	2.18	1.30
Amotivation	2.32	1.14

CONCLUSION AND IMPLICATIONS

SDT has some important implications for environmental education. It may help better understanding of individuals' autonomous motives for participating in environmental behaviors. Also, SDT may be critical to develop effective environmental education programs and to create pro-environmentalists or activists who could take important steps for the protection of environment (Pelletier, 2002). Moreover, the development of MTES based on the SDT and adaptation of it into different languages may contribute to in-depth investigation of the interaction between environmental behaviors and motivation and to integration of the environmentally responsible behaviors into people' lifestyle (Pelletier, et.al, 1998). In the light of all these issues, to grow individuals who have more self determined motivation toward environment, SDT guided environmental courses may be integrated to teacher training programs.

EXPERIENCING LEARNING SUPERVISION SCIENCE THROUGH ATYPICAL USE OF ECLECTIC MODEL OF TEACHING FOCUSING SOCIO-CULTURAL AND HUMAN VALUES EFFECTS

Nazila Karimi

Islamic Azad University

kariminazila@yahoo.com

Mohammadreza Behrangi

Tarbiat Moallem University
Regional Office of IOSTE in Persian Gulf Countries

behrangimr@yahoo.com

ABSTRACT

Demonstrating how new teaching approach (eclectic model) in teaching supervisory science would lead to enhance instructional effects and nurturing socio-cultural and human values of learners to live with in the contemporary global society. The research is a semi-experimental case-study. The researchers made 65 items questionnaire administered to a sample size of 51 randomly selected students from School of Educational Administration in Islamic Azad University of Science&Research**.** Data was analyzed to compare the effects of lecture method with eclectic model. Findings show the significant effect of eclectic model and allow recommending the use of it in teaching other chapters and courses.

Keywords: *eclectic model of teaching, supervision, nurturing effects, lecture method.*

INTRODUCTION

Findings from many investigations on the quality of education in the whole world indicate the schools have disruptive effects on learners' innate capabilities and understandings. It seems to be a revolutionary work to teach in atypical trend and bypass the inertia of existing educational administration to orient teaching for learners understanding of socio-cultural and human values. In this study main concepts of educational supervision such as supervisors' characteristics, supervision definitions, key concepts, incremental expansion of the role, different components in supervision, and new technology will be considered (Wiles & Bondi, 2004). The critical concepts are taught in two different ways, lecture method and eclectic model of teaching. The eclectic approach combines concept attainment and inductive models of teaching for affecting cognitive information processing. It also uses role playing, and jurisprudential inquiry models of teaching for nurturing effects. The article indicates one sample of bit after bit endeavor of serial cases on using the approach in teaching chapters in supervision course. The researchers made 65 items questionnaire by Likert scale with five degree of agreement (1 to 5), investigates the view of the graduate students attending the course of supervision. Sample size is 51 randomly selected (Krejcie & Morgan's table (1970) & Yamane formula (1967))students of educational administration of Management and Economic School in Islamic Azad University of Science and Research with 32 female (62.7 %) and 19 male (37.3 %). Findings are classified into two categories of instructional and nurturing effects. The nurturing effects embodies items such as personal integrity, comfort in expressing opinions, skills in negotiation, enhancing empathy and pluralism, finding facts about social problems, capacity for social involvement and desire for social action, self-esteem, academic and social motivation, learning capacity, ability to assume role of the "others" competence in social dialogue and achievement. The instructional effects embodies items such as: self-understanding and reflection, self-development of concepts, framework use for analyzing social issues, effective group process and governance, constructivist view of knowledge and discipline of collaborative inquiry, learning with the process of problem solving and inquiry, making hypotheses and definitions of concepts (Joyce, Weil & Calhoun, 2009).

METHOD

Determining reliability of questionnaire after a pilot study with 15 students, shows reliability of questionnaire: Cronbach's Alpha for Inductive (item1-12) =0.885, Attaining concepts (item13-26) =0.899 Advance organizer (item 27-41) =0.928, Role playing (item42-52) = 0.911, jurisprudential inquiry (item53-65) = 0.927, lecture method (item1-65) = 0.947, Eclectic model (item1-65) = 0.958.

Regarding hypothesis 1, finding shows (**Table 1**) that with 99% of confidence level the differences between scores of eclectic model and lecture method are significant, so null hypothesis 1 is rejected:

Table 1. Descriptive Statistics & Wilcoxon Signed Ranks Test for instructional and nurturing effects

Scores	N	Mean	Minimum	Maximum	Wilcoxon Signed Ranks Test
Sum score eclectic. m (Instructional effect)	51	134.27	98	155	Z= -6.188 (a)
Sum score lecture. m (Instructional effect)	51	68.08	38	155	Asymp. Sig. (2-tailed)= .000
Sum score eclectic .m (nurturing effect)	51	150.71	100	170	Z= -6.215 (a)
Sum score eclectic .m (nurturing effect)	51	61.47	33	147	Asymp. Sig. (2-tailed)= .000
Sum score eclectic. m hole effect	51	284.98	198	325	Z= -6.215 (a)
Sum score lecture. m hole effect	51	123.82	70	287	Asymp. Sig. (2-tailed)= .000
(a) sum score lecture method < sum score eclectic model					

Hypothesis 2: There is no significant difference between instructional and nurturing effects of five models of teaching. Finding shows (**Table 2**) that with 99% of confidence level, the differences between scores of five model of teaching method is significant so hypothesis 2 is rejected:

Table 2. Instructional and nurturing effect of five model of teaching (Friedman test)

Models - scores	Mean Rank instructional effect	Mean Rank nurturing effect	Mean Rank instructional & nurturing effect
inductive model	3.02	2.05	2.10
attaining concept	4.82	1.01	3.81
Advance organizer	4.14	2.98	4.89
role playing	1.00	4.57	1.20
Jurisprudential inquiry	2.02	4.39	3.00
N	51	51	51
Chi-Square	196.205	192.579	171.204
Df	4	4	4
Asymp. Sig. (2-tailed)	.000	.000	.000

RESULTS & CONCLUSION

Findings indicate that, with 99 % of confidence level both eclectic model and five models of teaching have significant instructional and nurturing effects on students' learning in comparison with lecture method. Results of two hypothesis of study shows that the attaining concepts & constructive models have more instructional effect and role playing & Jurisprudential inquiry model have more nurturing effect in teaching the supervision concepts, therefore their use have priority and are highly recommended. Nurturing effect is related to socio- cultural and human values. As the findings of study showed, eclectic model of teaching can enhance these effects on students. There are many models such as simulations, picture words, indirect method, and partner in learning (Joyce, Weil & Calhoun, 2009) which are useful and effective for teaching concepts of academic courses. There are still needs to investigate the instructional and nurturing effects of these models of teaching and compare the results with their instructional & nurturing effects on students with lecture methods.

ABSTRACT

This study investigates the impact of video technology on the development of selected students' meta-cognitive strategies Isfahan University in Iran. 310 students from the whole 1600 were selected based on cluster random sampling. The samples of students of experimental and control groups were selected from all of the University of B.A. 155 of them had access to video technology for English language teaching and the other 155 did not. The data were collected based on a researcher made questionnaire. An independent t-test was employed to compare these two groups. The results indicate that although using technology enhances the students' meta-cognitive strategies it does not have the same effect regarding planning, control and supervision, constructing order.

Key word: *digital literacy, technology, video technology, meta-cognitive strategy*

INTRODUCTION AND LITRATURE:

In education's field, using modern technology should be a means toward improving learning and education. As Behrangi (2005) indicates regarding digital and up to date sources in the development of learning and new literacy, this technology has important role at the present time provided that it's suitable use and its flexibility in using time, place, age, acceptance and fitness with the new jobs to be considered. He also reiterates that this century students' interactions and involvements have been extended and overcome the classroom constrains of data gathering through the use of suitable computers programs, electronic networks, and audio-visual media. This study focuses on meta-cognitive strategies and video technology as a type of new digital literacy.

Learning skills are divided in two parts, cognitive and meta-cognitive. These idioms complete each other. Cognitive skill us point to the process that we can learn, think and remember. Meta-cognitive refer to our knowledge about our meta-cognitive process and more using of them to reach to purposes of learning (seif, 2006). Meta-cognitive is defined as knowledge and awareness about our cognitive system or knowledge about knowing. The ones` awareness about itself, he or she makes able to supervise and direct her/his suitable thoughts (Ahadian quoted from Anderson, 2009). By the use of Meta cognitive, a person is capable to, manage and lead his/her learning. Meta cognitive involves three types of important information: the knowledge that is related to the individual interests, preferences, and general awareness and knowledge on his/her learning, the information that related to the difficultly of the task, and knowledge on learning strategies techniques such as precise reciting in reading. The person's knowledge on his information, help him/her to use them in three meta- cognitive strategies (Afzalnia, 2006). The first strategy is programming strategy, learner is capable to plan through determining goal, predicting the time of study and setting the speed of study. The second strategy is Control and supervision strategy that in improvement of the process is leaded by the person through formative evaluation procedure. Purpose of control and supervision strategy is learners' measurement of his/her work and recognition of the way of progress and directing it. Final strategy is Constructing order strategy: Tthis strategy make more flexibility in behavior learner and helps him to change his method and style of learning any time that is necessary. The constructing order and supervision strategies are applying in a harmonic way (Afzalnia, 2006).

METHODS

This effect is kind of half-empirical research. In this study, the abilities of students meta-cognitive are measured in two groups: Experiment group and control group. In experimental group, in addition to the usual methods what were applying in control group, also video technique is used. The information about students' meta-cognitive skills in both groups is collected by applying a questionnaire (45 questions) of researcher-made that the reliability coefficient of this is 0/824. An independent t-test was employed to compare these two groups in three strategies.

RESULTS

Findings indicate that based on obtained results by counted T is bigger than critical amount of table in 0/01 and 0/05 level. There for, the first assumption of test (based on using video technology in training language results in development of students programming strategy) is supporting. So using this instrument helps learners for making purposes for learning, forecasting of necessary time to study and setting the speed of study. Based on obtained results by counted T is bigger than critical amount of table in 0/01 level. So, the second assumption of test (based on using video technology in training language results in development of students' control and supervision strategy) is accepted. This strategy causes that learner repair or change in time. Also, this strategy makes him able to increase attention and focus during a study. In the end, based on obtained results by counted T is bigger than critical amount of table in 0/01 and 0/05 level. So, the second assumption of test (based on using video technology in training language results in development of students' control and supervision strategy) is accepted. This strategy causes flexibility in learners' behavior and helps him to change his method and style every time that is necessary.

CONCLUSIONS:

The data in this study reminder that The programming and constructing order strategies are using video technology method more than control and supervision strategies strategy. The reason can be expressed by this way that, using this method in class and training situation make it possible to access to high level cognitive purposes i.e. (analyzing and evaluated). So learner will be able to direct their study, memorize and remember their information and arrange them. Also if there will be any problem in learning, defect point will be recognized immediately and will be diagnosed that the problem is coming from themselves subject or training method. Thus they can have an exact constructing order and programming on their learning. Science by considering the results can be suggested to people who are responsible in training that compiling educational lessons in textbooks should be proper with students' ability, put meta-cognitive strategies as a part of educational program and make possible using modern learning equipment in schools and universities. Also suitable educations in order to develop human forces should be done to becoming familiar with meta-cognitive strategies, helpful instrument for training and how to use them in class situation.

ABSTRACT

Although some early elementary teachers may hesitate to teach science, either because they do not feel qualified or because they feel that reading and math take priority (Marx & Harris, 2006), schools and teachers are becoming increasingly accountable for their students' science learning. By using the Bybee's (1997) 5-E Learning Cycle as a framework, a second grade science curriculum was designed to individualize student instruction (ISI-Science). The study employed both science process and literacy skills through hands-on activities and the use of text. Results showed that students' science and literacy scores improved at the end of individualized and integrated science and literacy instruction regardless of their initial science knowledge.

Keywords: *5-E learning cycle, elementary science, individualizing student instruction*

INTRODUCTION

In recent years, influential policy reports (National Academy of Sciences, 2006; National Science Board, 2007; U.S. Department of Education, 2000) emphasize the need for equal time for science, mathematics, and language arts teaching. However, in national comparisons, teachers reported spending consistently less time in science instruction compared to language arts and mathematics (Center on Education Policy, 2007; Fulp, 2002; Weiss & Pasley, 2004). With the demands of the *No Child Left Behind Act* and the increasing emphasis on students' reading performance, teachers may believe that time spent on science impedes students' reading development and, therefore they devote less time to science instruction compared to language arts and mathematics (Marx & Harris, 2006). Teachers also may not be provided with adequate science background knowledge and support to feel comfortable teaching the subject (Fulp, 2002; Weiss, Banilower, McMahon, & Smith, 2001).

National Science Standards state that students should be able to learn science concepts and processes more effectively when they engage in meaningful activities through manipulating materials (National Research Council, 1996). When hands-on activities are integrated with concept-focused teaching, reading of science print materials, and writing, both science understanding and reading achievement may be improved (French, 2004; Romance & Vitale, 2001). The purpose of this study here was to develop and assess the efficacy of a second-grade science curriculum that integrated science and literacy learning objectives with the goal that students would improve both their science content knowledge and their overall literacy skills.

Research Questions: 1. Did students' knowledge of science content improve from pretest to posttest? 2. Did students retain Unit 1 knowledge as assessed by multiple choice and open-ended items? 3. Were students who showed the lowest level of science knowledge on the pretest able to make the same gains in target content knowledge as students with higher pretest scores?

METHODS

The study included 6 second-grade classrooms, located in a mid-size South-Eastern City in the U.S. 96 children participated in this study (45 girls, 51 boys). About 50% of students were living in high poverty homes. More than 50% were African American, 40% White, and the remaining consisted of other ethnic groups. Classroom teachers (6) and research-funded teachers (3) were all fully certified to teach in elementary schools.

Two science units that were tailored toward individual students' needs and integrated with literacy were developed. The two units spanned throughout six months with each lesson lasting 30-40 mins. Research-funded teachers taught the first lesson in all classrooms while the classroom teacher observed and assisted. Responsibility for teaching subsequent lessons alternated between research-funded teachers and classroom teachers. To structure the lessons within the unit, the 5-E Learning Cycle (Bybee, 1997) was used. Each lesson included activities where students engage in hands-on/minds-on learning, discussion, reading, and writing. S*trategic flexible grouping of students*, individualized reading materials and worksheets were utilized. Student learning was assessed by a science knowledge unit test, in addition to standardized tests, completed the week prior and the week following the six-week unit. Unit tests were designed by the researchers to assess student science learning in areas of instruction (i.e., target content) as well as in related areas that were not directly taught (i.e., nontarget content). Both tests generated an α reliability coefficient of 0.90. Series of paired sample *t*-tests with Bonferroni correction were conducted to determine if the average gains made from pre- to post-tests were statistically significant. Independent *t*-tests were conducted to determine the differences in the gains of students with the low and high levels of science knowledge.

RESULTS AND CONCLUSION

Students' science and literacy scores significantly improved at the end of individualized and integrated science and literacy instruction. Regardless of students' science pretest score (lower or higher), on average, they made the same gains. Students retained Unit 1 knowledge even after four months of its implementation. Students generally showed greater gains on the science topics that were explicitly taught during the unit than on related topics that were not explicitly taught.

Teachers were able to implement the science curriculum and contribute important ideas and extensions so that it worked better in the classroom. Individualizing instruction in science benefited students with weak science and literacy skills as well as students with strong science and literacy skills. This study did not intend to show that ISI-Science curriculum was more effective than other curricula or using other strategies; we compared only the pretest and posttest scores of students who received the curriculum. For future research, we plan to compare the ISI-Science curriculum to the core science curriculum used in the schools by randomly assigning teachers to teach science using either ISI-Science or the school curriculum. Nevertheless, our results so far are encouraging.

INDIGENOUS KNOWLEDGE SYSTEMS: PROCESS VS PRODUCT

Moyra Keane

University of the Witwatersrand,
Johannesburg, South Africa

moyra.keane@wits.ac.za

ABSTRACT

This paper draws on research into Indigenous Knowledge (IK) in science education with both rural and urban communities in South Africa. I present findings on a) drivers for work in IK; b) Educators' perceptions of IK; c) examples of the value of process over product. In the light of new education policies, teachers are grappling with questions such as: 'What is IK?' 'What is the value of it?' 'Does "it" belong in the science curriculum?' Yet, perhaps we should be discussing 'What processes lead us to knowing?' 'What are the features and value of this intellectual journey?'

Keywords: *Indigenous Knowledge, science curriculum, epistemology.*

INTRODUCTION

Outcomes, products, results easily draw attention and claim significance. A product is generally more definable and quantifiable then a process. It is hence easy to miss the value of process. In integrating IK into the learning and teaching of science, it is the opportunities for discussions, for reflection, for the problematising of troublesome knowledge, in the struggle to reconcile conflicting perspectives, that rigour in the intellectual endeavour is nurtured. This paper therefore focuses not on Indigenous Knowledge as a product to be included in science learning but on the opportunities provided by considering our motives for engaging in the debate, concerns around the intersections of science and IK, and perceptions of valid knowledge.

Two research projects, one in urban schools and one in a rural community indicated that drawing examples of IK into science lessons increased interest and created relevance for students. This was also the finding of Manzini, (2000) and Malcolm, (2004) who worked in similar communities. However, finding examples of relevant IK remains elusive in many settings and for many teachers. This difficulty often deters teachers from considering IK as an aspect of the science classroom – in spite of this being Education Department policy.

DRIVERS FOR WORK IN INDIGENOUS KNOWELDGE: PROCESS vs PRODUCT

The reasons for the rise in interest in promoting IK are generally well accepted. I summarise these briefly. One of the drivers is redress. Indigenous ways of knowing have been excluded from school and university curricula for decades and IK has often been denigrated, where it has a valuable contribution to make on a variety of levels (Emeagwali, 2003). In national efforts towards transformation, inclusion and social justice, multiculturalism, and multilingualism are being promoted. The second reason for seeking to include IK into curricula is the belief that contextualised learning and learner-centred approaches promote epistemological access and enhanced concept development. A third reason is the intrinsic value of IK which may for example contribute to global solutions to environmental problems.

A fourth reason for more general interest in IK is the potential commercial benefits – for example in ethnobotany. At the policy level there is some agreement with the arguments presented here. Difficulties arise however for science educators in South African schools as they try to determine exactly what IK is appropriate for inclusion into science classrooms.

METHODS

Data for the arguments presented here have been drawn from aspects of two studies as well as a seminar series for academics working in IK. One study in rural schools explored teachers' and community's ideas about relevant science (which included IK); the second study, in a cluster of urban schools, sought teachers' perceptions of IK and their willingness to include it in their science teaching. The seminar series took the form of debates, reflective writing, stories, and research experiences in IK. I have drawn out common features from these projects to argue for the value of the inclusion of IK into science curricula.

RESULTS

Teachers and/or community elders in our projects defined various categories of IK: hidden knowledge for specific groups (mostly relating to roles in the community); myths, superstitions and spells; basic technology; ways of living in nature and ways of seeing the world. Finding examples from these categories that may be included in science curriculum proved difficult. Participants agreed that these categories overlap and are possibly inseparable. Many students' and teachers' experiences of IK include religious and supernatural aspects which they are reluctant to bring into the classroom.

CONCLUSIONS

It is the process of wrestling with this difficult conundrum that the fifth driver for the interest in IK emerges. This is the contribution IK can make to freeing us to some extent from fixed paradigms and habitual ways of seeing and being in the world. In this last driver for promoting IK we find some consonance with scientific and intellectual endeavours. I am not arguing to negate other reasons for the promotion of IK in science curricula, but by acknowledging the value in the very process of investigating knowledge claims and status we are able to become more reflective thinkers, more tolerant human beings, and are also able to reconcile some of the paradoxes and difficulties in determining *what* IK to include in science teaching.

ABSTRACT

This study investigated the use of Slowmation to assist preservice teachers to discuss issues of teaching and student learning and reflect on their developing pedagogical knowledge. After being introduced to Slowmation at university and making their own movies, the preservice teachers taught science in secondary schools using the procedure during their teaching placement. After placement, when the preservice teachers returned to university classes they were required to show their completed students' movies to the class. These presentations were conducted in a way that allowed the preservice teacher presenting the movies to be in control of the class and the discussion. This instigated rich conversations about teaching, learning and understanding of pedagogy between the preservice teachers. The authors assert that Slowmation is an effective teaching procedure to engage preservice teachers in rich conversations that build on their shared experience to review and reflect on their teaching. Such rich conversations assist preservice teachers to assimilate their developing understanding of teaching and learning into a coherent model of pedagogical knowledge.

Keywords: *Science Teacher Education, Technology, Developing Pedagogical Understanding.*

INTRODUCTION

This paper is based on the work of the authors as they teach in the science curriculum unit of the final year of the teacher education program at Monash University in Clayton, Australia. Slowmation is a Teaching Procedure (Mitchell, 2009) where students design and create short movies of their understanding or science concepts. Students make models of scientific concepts, take digital still images of the models and join them to make short 2 – 3 minute movies. This paper offers a further investigation (Keast, Cooper, Berry, Loughran, & Hoban, 2009) in addressing the problem, "How do preservice teachers synthesise the elements of learning about teaching into a coherent model of pedagogical knowledge?" Slowmation is being used by the teacher educators at Monash University in a way that encourages pre-service secondary teachers to make public their developing understanding of their personal pedagogical knowledge (Morine-Dershimer & Kent, 1999). This gives teacher educators an insight into how preservice teachers are forming their conceptions and understanding of personal pedagogical knowledge.

METHODS

Like Nicaise and Crane (1999), this Slowmation research design used a qualitative and descriptive approach drawing together data from multiple sources: preservice teachers' presentations of their students' Slowmation movies; lecturers' field notes from presentation sessions; journals kept by the lecturers; and, the lecturers' guided reflections on each other's journals. Such a research design then led to a grounded theory framework for analysis such that knowledge was built-up from the complex description of the classroom (Nicaise & Crane, 1999) and lecturer-student, student-lecturer, lecturer-lecturer and student-student interactions. During their 5 week placement preservice teacher were asked to teach Slowmation to their students during practicum and to show their students' completed movies to their General Science peers on their return to the university.

RESULTS

Due to space limitations in this short paper, the authors use one example of two pre-service teacher's reflection on their teaching, though in the full paper several issues will be analysed and discussed. The preservice teachers agreed that the process of Slowmation was useful for helping them to identify students' alternative conceptions of a science concept. One preservice teacher commented:

The major conception they had before they started, was they had the light and dark reactions mixed up [in photosynthesis], and didn't show how the process worked, ... the Slowmation did reveal to me areas that students didn't fully understand and where I needed to re-teach the ideas. (PST1, Classroom presentation, 2007)

The student's work on their Slowmation movies gave the preservice teachers opportunities in which they could 'see' their students' understanding and could monitor their learning. They were able to identify their students' alternative conceptions. The discussion of slowmation gave preservice teachers an opportunity to explore their personal practical experience (Morine-Dershimer & Kent, 1999) and reflect on the implications of when to teach in the unit (an example of personal pedagogical knowledge, Morine-Dershimer & Kent, 1999). Working with science concepts at a technical level (in terms of Slowmation as a teaching procedure) introduced preservice teachers to new understandings of the complexity of some abstract science concepts.

CONCLUSIONS

Finally, what has been significant for the teacher educators is not that Slowmation is an innovative and novel activity for preservice teachers to use in classrooms with their students, but that slowmation has been used in a way that encourages preservice teachers through discussion of their experience to articulate and synthesise their developing understanding of pedagogical knowledge. Such discussions appear to place them well down the path in their journey to building the coherent pedagogical knowledge they need to be an expert science teacher.

ABSTRACT

The focus of the paper is the question whether a teacher-centred "tour through the zoo" is more effective in terms of learning and retention than a learner-centred, group-based work following the self-determination theory Deci & Ryan. So far there are no surveys on the short-term and long-term success of these cognitive forms of education at the zoo. In addition, two forms of learner-based instructions were tested: group-based work followed by peer-tutoring and group-based work followed by a teacher-centred instructional part.

The data were collected using paper and pencil test. The cognitive evaluation divided into pretest, posttest and follow-up test.

Keywords: *empirical study, emotion, out- of- school learning settings, gender diversity*

1. THEORETICAL BACKGROUND AND OBJECTIVES

The focus of instruction at zoos as a place of learning is the encounter with the living animal. The pupils will receive insight into the biological basis and laws (adaptations) through their own observations and experience and recognize their importance for present and future life situations.

This teaching is based on self-determination theory by Deci & Ryan (1985), i.e. there is a lot of emphasis on autonomy, competency and social relatedness. These three universal basic needs support the intrinsic motivation and forward interest. A supportive self-motivation has a positive effect on the school interest.

Furthermore the theoretical basis of the study is both the moderate constructivism (Duit, 1995) and recent studies from the motivational psychology (Gläser-Zikuda et.al. 2005).

Cognitive psychology believes that contents are better retained if the teaching is more action-oriented (Deci & Ryan, 1985). Action orientation is inspired by constructivism, that is active and self-directed learning leads to self-knowledge. Only what the pupils themselves worked out is actually learned. The pupil does not adopt the given knowledge of the teacher wholesale but also the pupil has their own meaning to new material. Applied to the subject biology, this means all the more the pupil can operate independently and for example observed biological facts on the animal itself so much better the pupil will retain the knowledge.

There already exist studies which show that emotions affect the learning behavior (Gläser-Zikuda et al., 2005). According to psychology we remember more easily to emotional situations. Sensory perceptions such as primary experience in biology through observation of animals promote learning. Lessons the pupils are interested are better kept in their mind because the lessons are important for the pupils and intrinsically motivating.

The study checks the validity which self-determination theory, constructivism and findings of the motivational psychology can be applied to the transmission of knowledge at zoo as a place of learning.

It examines the following forms of instruction:

- group-based work (learner-centred) with the evaluation by pupils (peer-tutoring)
- group-based work (learner-centred) with the evaluation by teacher and pupils
- presentation of learning content by teacher (teacher-centred) in the form of a tour through the zoo.

Furthermore the research questions are:
1) What is the relationship between emotions such as interest, physical well-being, boredom and learning?
2) What are the differences in retention of girls and boys?
3) What are the differences in retention between pupils of secondary school and secondary modern school?

2. METHODS

A quantitative empirical study was carried out in the zoological garden of Bernburg (Germany, Saxony-Anhalt). 845 pupils of the fifth and sixth grade (10 to 13 years of age) participated in this study: 415 pupils of secondary school and 430 pupils of secondary modern school participated in the study. Studies show that zoological topics of interest to particular pupils of the orientation course pupils only attend the fifth und sixth grade. The selection of animals that were observed was based on the observation possibilities and of their adequacy to their habitat. The assignment of the classes in the different treatments (group-based work with the evaluation by pupils, group-based work with the evaluation by teacher and pupils, presentation of learning content by teacher, in the form of a tour through the zoo) was randomized. The division of groups within a class was also randomized. The data were collected using paper and pencil tests. The experimental approach followed a BACI design (before-after/control-impact) to control for confounding variables (Randler & Bogner, 2009). To check the effect of repeated testing after Keeves (1998) pupils are also tested who visit the zoo but not did participate in any treatment (control group). Before the day of study all pupils participated in a pretest to determine their previous knowledge. On the day of the study the pupils wrote a group test to determine the knowledge after the group-based work. After the execution of the specific form of instruction pupils wrote a posttest to check the knowledge after they heard details about all animals. It follows the emotional evaluation using state questionnaire (multiple choice items, open items). Six weeks after the zoo visit the follow-up test was carried out in the school.

3. RESULTS

The empirical study will be completed in February 2010. The first results are expected in May 2010.

ABSTRACT

The new primary education curriculum has been prepared in line with the constructive approach and was put into practice in every elementary school of Turkey in 2005-2006 session. Therefore, course books, student workbooks and teacher guide books for science and technology course have been developed according to philosophy of this curriculum.

In this research, the universal socio–cultural and humanistic values in 6^{th}, 7^{th} and 8^{th} grade science and technology course books are investigated. This study showed that in 6^{th}, 7^{th} and 8^{th} grade science and technology course books; interested in all life, curiosity, healthy life values were the most studied; respecting/appreciation, loving the nature, different places, gratitude values were partly; unity/interdependence, friendship, happiness, compassion, citizenship, bravery, mercy, leadership, sharing, trust, patience, forgiving, stoicism, time management, generosity, discrimination and self–analysis were very rare. Optimism, tolerance, truthfulness, frugality, self–control and honest values were never studied.

Keywords: *Socio-cultural and humanistic values; Science and Technology; course books*

INTRODUCTION

Human and value relationship and problems that are connected are, wide scope and can be studied in different aspects. It's known that there are types of values like ethic, aesthetic, religious etc. However, their content and clarity are different, all values are common in the view that, they are created by human beings, acted by human beings. On the basis of the actions occurring and the acts coming true in human and the culture world, again the meaning and the values created by human lies.

Socio-cultural and humanistic values which are accepted as universal are (Doğanay, 2006);

a) Love (mercy, friendship, generosity, compassion, loving the nature)
b) Inner peace (frugality, happiness, patience, self-control, respect, healthy life, stick ability)
c) Truth (universal love, curiosity, discrimination, self-analysis, being interested in whole life)
d) Right Conduct (honesty, courage, leadership, time management, unity, gratitude)
e) Avoiding Violence (forgiving, citizenship, optimism, tolerance, sharing, truthfulness)

Value education is done by implicit curriculum and teaching affective behaviors to the students. Implicit curriculum, as a part of learning process at schools or in classrooms, consists of knowledge, values, attitudes and beliefs, which are generally unnoticed or unconsciously given (Horn, 2003).

When organizing the scientific attitudes and values in Science and Technology Course 6th, 7th and 8th Grade curricula, a categorization which consists of five categories was used. This categorization consists of easy to difficult, student's perception of happenings on their environment willingly, responding positively according to the situation, developing positive attitudes, organizing these values in her/his self-esteem and lastly developing a positive living style including positive attitude and values, phrases. In the section of learning areas and units, there is a list of attitudes and values which are desired to instruct to the students.

METHOD

As search scanning model, document survey technique was used. Document survey covers the analysis of the written material which includes knowledge about the fact or the facts which are intended to be searched (Yıldırım and Şimşek, 2005). To this end, in the course books which are thought at the 6th, 7th and 8th grades, it is stated that how many places or activities include universal values implicitly or explicitly. The data collected from qualitative studies, are analyzed in two ways as descriptive and content analysis (Strauss & Corbin, 1990). In this study data were analyzed using descriptive analysis. In addition determined the state of how the values are thought.

Findings and Comment

In this study, the question of "How and how much humanistic values teaching takes place in Science and Technology books in Turkey?" was tried to answer. For this aim, the outcomes of socio-cultural and humanistic values, accepted as universal and grouped under five major titles are listed below. In Table 1, under main titles, according to the classroom levels, values' teaching states are shown.

Table 1. According to the main titles, how many times values were studied in Technology and Science Course Books

VALUE	*6thGrade*	*7th Grade*	*8th Grade*	*TOTAL*
Truth	130	132	123	385
Inner peace	40	52	27	119
Love	12	18	12	42
Right Behavior	12	9	11	32
Avoiding Violence	3	3	7	13
TOTAL	197	214	180	591

OUTCOMES

1. Under the love value, "loves the nature" is the most studied in the 6th, 7th, 8th grade course books. The least studied value is generosity.
2. Under the inner peace value, the most studied value is healthy life in the 6th, 7th, 8th grade course books. Frugality and patience values weren't studied at all.
3. Under the truth value, the most studied values are curiosity and being interested in life values in the 6th, 7th, 8th grade course books. The least studied value is generosity.
4. When all the 6th, 7th and 8th grades are considered; under the "right behavior" value, "appreciation" value, is the most studied behavior. While time management and leadership values are studied a little, it's seen that honesty value wasn't studied at all.
5. When all the 6th, 7th and 8th grades are considered; under the "avoiding danger" value "citizenship" is the most studied behavior. While forgiving, sharing and trust values are similar and they were studied minimal level, time management and leadership values were studied in minimal level, optimism, tolerance and truthfulness were never studied.

6. When socio–cultural and humanistic values inspected under main titles, “truth” and “inner peace” were studied the most, love and right behaviors values were studied in average level, avoiding danger was studied the least in the course books.
7. When the universal socio–cultural and humanistic values in the course books are investigated under sub titles:
    a. Interested in all life, curiosity, healthy life values were the most studied;
    b. Respecting/appreciation, loving the nature, different places, gratitude values were partly;
    c. Unity/interdependence, friendship, happiness, compassion, citizenship, bravery, mercy, leadership, sharing, trust, patience, forgiving, stoicism, time management, generosity, discrimination and self–analysis very rare;
    d. Optimism, tolerance, truthfulness, frugality, self–control and honest values were never studied.

ABSTRACT

The PhD study's paramount objective is to develop knowledge about girls who choose to study subjects where females are in minority, in an effort to help break down the barriers that prevent other girls from doing the same. The informants are first- and second-year college and university students in Norway. Through a qualitative narrative analysis of seventeen written stories in which these girls describe and justify their educational choices, I will describe what opportunities they see that other girls are missing and show how they experience being a minority group. This research may be informative for future initiatives towards better gender balance in higher education.

Keywords: *Gender, choices, values, recruitment*

INTRODUCTION

Few young people are choosing to study STEM (Science, Technology, Engineering and Mathematics) at the tertiary level. The worlds of academia, industry and politics are calling for more scientists and engineers, and the media are writing about a recruitment crisis. Meanwhile, more young people than ever before are taking higher educations. In many countries, the percentage of women in tertiary education has exceeded 50 per cent. For some reason, the story is different in science and engineering. STEM disciplines are struggling to recruit students, especially female students. Politicians and institutions of higher education are touting the unexploited potential of European women, also because girls do at least as well on international tests that measure skills and knowledge. Others justify the need for women in STEM by contending that subjects need 'female values'. Both arguments take their point of departure in society's needs more than in the individual's needs. Among other things, I will discuss the arguments in the light of the girls' own stories, relevant empirical data and theories inspired by sociological, anthropological and gender theory perspectives.

Over the past 30 years, large resources have been spent on recruitment measures to the STEM sector. These actions have been more or less successful. Certain niches in science and technology have seen short-term booms, but the big picture has not changed in line with the incentives, especially not if one compares the trend with the number of women studying other subjects. We know a great deal about adolescents' attitudes to STEM (Schreiner & Sjøberg, Eurobarometer, etc.) and young people's academic performance (TIMMS, PISA. etc.), but we have little documented knowledge about what it is that makes certain girls choose STEM, where females constitute a small minority. To help reduce this gap in our knowledge, I will discuss the possibilities these girls see that others do not see. I will use the women's own stories to break down barriers, identify opportunities and, hopefully, develop more effective interventions for recruiting more girls to STEM.

METHOD

The girls in the sample are first- and second-year college and university students in Norway between 18 and 22, who have chosen to study STEM subjects where females are in minority. The stories were collected in autumn 2009 (www.naturfagsenteret.no/skrivdittvalg).

I will make a narrative in-depth study of seventeen out of a sample of seventeen written stories in which the girls describe and justify their educational choices. The methodical approach has been chosen to understand, describe and explain the girls' choice of STEM, based on the understanding that the structure of text is the structure of meaning. To systematise the stories, I am using the programme NVivo.

I take an interdisciplinary approach to the study. The project uses a phenomenological research approach and focuses on the girls' life world and their understanding of it, where interaction, relationships and language play key roles. I have chosen a qualitative narrative approach to shed light on the relationship between girls' self-image, identity, expectations of mastery, roles and interests, and their choices in relation to STEM. In so doing, I am linking this research project to a view that emphasises individuals' understanding and perception of their place in relation to their surroundings.

The study is designed as a longitudinal study where the goal is to follow young women through higher education and into the world of work, to be able to document knowledge about women who choose, study and embark on careers in science, technology, engineering and mathematics.

RESULTS

The narratives indicate that the girls who choose STEM differ in many ways. However, all of the seventeen informants describe barriers in the form of myths and prejudices, experience of being alone and different; that the girls who choose STEM do not fit into the stories told about scientists and engineers. These girls are highly motivated for success, and they are resolute and determined despite some descriptions of serious objections from their surroundings since childhood. Another common characteristic of the stories is the part played by the parents. Fathers play an especially important role, even in families where the mother or other close relatives have a scientific background. The girls describe different experiences with STEM during childhood, for better or for worse, and they have different experiences from elementary school and high school. Several state that they feel at home in classes with others who strive for good grades and are good students. Their interest in STEM is often described in positive and emotional terms. Mathematics and physics are mentioned as whetting their appetite for STEM. All the girls describe themselves as social, although some are more socially aware than others, while all the authors are concerned about mastering and completing the goals they have set. The stories bear witness to finely honed linguistic awareness and mature thoughts in connection with the girls' own choices.

CONCLUSIONS

Based on analyses of the girls' own stories, I discuss the findings in the light of existing empirical data on girls who opt for STEM. The results are therefore considered in connection with analyses of data from the quanitative questionnaire surveys in the Norwegian "Vilje-con-valg" research project conducted in autum 2008 and the collaborative EU funded research project IRIS – both projects addressing challenge that few young people, and women in particular, choose education and career in STEM. The findings are described and discussed to develop new knowledge about girls educational choices. This research will hopefully raise the awareness of why some girls choose science, and may be informative for future initiatives towards better gender balance.

This research is hopefully informative for professional advisers, science education organizations and politicians as it will raise awareness of why some girls choose to study subjects where females are in minority – in an effort to improve the recruitment of girls in to science.

The analyses will be the point of departure for the further follow up of the girls through in-depth interviews with emphasis on findings from the analyses of the narratives, followed by focus groups to discuss possible interventions and initiatives.

ABSTRACT

A teaching module that includes inquiry activities, an industry site visit, and activities related to reading and writing, was designed following principles of design-based research (DBR), implemented, and evaluated. The module includes several features intended to promote students' interest and motivation towards science and science related occupations. The features are based on the Self-Determination Theory (SDT) of Deci & Ryan and interest theory of A. Krapp. During the design process, data were collected about how students (ages 13-15, N=139) with different motivational orientations, and teachers, experienced the module, and the motivational features of it. Based on the data analysis it is discussed which ones of the designed features really were motivating in the students' and teachers' opinion.

Keywords: *motivation, interest, out-of-school learning, site visit, inquiry activities*

INTRODUCTION

The problem of decline in young people's interest in science, and in pursuing scientific careers, is a significant concern of science education researchers, but an effective way of solving it is absent. Osborne, Simon & Collins (2003) argue that research on motivation should be taken into account when searching for possible solutions to the problem. The concept motivation in this study is examined in the light of self-determination theory (SDT) (Deci and Ryan, 2004). According to SDT, motivation style may be *autonomous* (*self-determined)* or *controlled,* or motivation can be missing, at which point person is *amotivated.* Autonomous motivation exists when people experience satisfaction of their basic psychological needs that are needs for autonomy, competence and social relatedness. Interest has close relationship to intrinsic motivation and experience of self-determination. Interest is a content-specific concept, and it encompasses feeling and value related components (Krapp, 2007). Interest can be personal or situational. Situational interest is aroused by something in the environment, and it may develop into more persistent personal interest.

Based on the literature review and analysis of teachers' needs, a teaching module was designed following principles of Design Based Research (DBR). There are several motivation and interest supporting features, based on the SDT and interest theory, included in the module. The module includes inquiry activities, an industry site visit in an authentic context, and activities related to reading and writing. In more detail, students prepare themselves to the visit with inquiry and ICT tasks. During the visit they see science and technology (S & T) applied in an authentic context, meet people who work in the field, and ask them questions. After the site visit, students process the information gathered in the visit further by writing articles and constructing concept maps.

The research questions is: How do students and teachers experience the module, especially features intended to promote interest and motivation towards science and science related careers, and to what extent did the students' and teachers' experiences meet the ideas of the designers?

METHODS

The module was designed using DBR approach that aims to improve educational practice. Juuti and Lavonen (2006) summarise DBR as follows: 1) DBR takes place in iterative cycles of invention and revision, starting from a need for change in practice, then proceeding to theoretical problem analysis and defining aims for a design solution, and finally finishing up to design and production phase. 2) DBR is collaborative, interventionist and generates a widely usable design solution that is directly applicable in praxis, and 3) DBR provides new educational knowledge. In the knowledge acquisition process, multiple methods are used.

In the process of generating new educational knowledge about possibilities of enhancing students' motivation and interest with the designed module, several sets of data were collected. Students' (N=139), ages 13-15, motivation orientations were examined with the Academic Motivation Questionnaire (AMQ) based on the SDT. Students were classified by K-means cluster analysis into groups *amotivation, controlled motivation* and *autonomous motivation.* Representatives of each group and the teachers were interviewed with a semi-structured interview, and activities were videotaped. Interview data as well as data from the content analysis of the module were categorized based on SDT and interest theories. The interview and video analysis results were compared to the results of the module content analysis. Thus it is possible to discuss which ones of the designed features really were motivating in the students' and teachers' opinion.

RESULTS

There are two outputs of the research: a theory based design solution, a novel teaching module, introduced in the introduction chapter, and new research based knowledge on motivational features of the module. Based on the content analysis of the module, it can be argued that the module includes features that support students feeling of autonomy, competence and social relatedness, and also the feeling and value related components of students' interest. Based on the interviews, students and teachers found the authentic context, meeting people who worked in the field of S & T, and possibility to work in collaborative groups the most motivating features of the module. However, students did not experience as much support for their feeling of autonomy and value related component of interest as it could have been expected based on the content analysis of the module.

CONCLUSIONS

In spite of students' motivation orientation, the interviewed students had positive feelings about the module, especially the site visit. Support for the feeling of social relatedness was important for them. They enjoyed working in groups and spending time together with their classmates. However, only few of the interviewed students mentioned that it was enjoyable to study together towards a common aim, not just spend time with friends. Support for the feeling of social relatedness in the direction of the aims of the module is an issue to be emphasised, In other words, value-related valence of interest has to be supported alongside the feeling-related valence. Thus the module would not just be an enjoyable experience solely constrained to the affective domain students' interest, but it could be a way of helping students to understand the relevance of their own science studies.

Possibility to see S & T applied in an authentic context was an important motivation promoting feature for the students. As a form of out-of-school education, the module appears to be well suited for enhancing students' motivation and interest towards science and related careers. Out-of-school visits also help students to improve scientific literacy in society, understand how S & T is applied, and inform them of the career possibilities in industry (Braund & Reiss, 2004). Students considered the visit relevant to their interest, which was an essential aim in our design process. Especially remarkable was that the amotivated students' critical eyes were opened for seeing the relevance of their science studies from the point of view of connecting school science and science applied in authentic settings in various fields. Furthermore, our model included activities of learning through reading and writing. The articles, written by the students, demonstrate that S & T has become closer to the students.

EZI EDUCATION- AN INNOVATIVE INITIATIVE TO MAKE EDUCATION FOR ALL A REALITY

Jashree A. Mehta

Director/SATWAC foundation

Email: satwac@gmail.com

ABSTRACT

Lack of education is one of the major challenges faced by developing world today. While lot of efforts are underway to enhance reach of education by opening new schools, hiring & training more teachers, and other conventional methods, an initiative in Gujarat, an Indian state, has tried "out of the box" thinking to solve this problem. Ezi Education project is an initiative which leverages modern technology, innovative model and creative delivery mechanism to make science and mathematics education Affordable, Accessible and Effective.

The paper will discuss this initiative, guiding principles and success/limitation factors.

Keywords: Science *Education, Technology, Satellite Communication, Multimedia.*

INTRODUCTION

In the new millennium, knowledge will dominate. New technologies acquired through knowledge will play a key role to improve human life, especially in the developing part of the world. As the world economy is undergoing the transition stage, the significance of the developing nations is rising as they have become the major growth drivers. While these economies embark on the growth path, there are several challenges on socio-economic front acting as barriers to development. Education is a key potential growth disrupter and a grave challenge being faced by all the emerging countries. Although the governments in these countries are making impressive budgetary allocations for education expenditure, the reach (access) and quality of education still remain one of the major bottlenecks.

In most of the developing countries especially countries with large geographical footprint, biggest challenge is limited access to science education. It is very difficult and economically unviable to have a fully equipped and well served school in each village. As these villages are at a substantial distances and lack transportation infrastructure the current practice of one school for a group of villages is not effective. Further very low pupil/teacher ratio (40.2% for primary and 32.7% for secondary education) hence poor attention of teachers, lack of Science laboratory or other educational tools, under-qualified and under-trained teachers, no education help at home (as many students are first generation learners) make it very difficult for students to pass the final year of the high school (10th grade) public examination. The average result for the last few years has been less then 50%. The majority fail in Science and Mathematics. Poor education leads to high drop-outs and low pass rate which means that small percentage of total population are able to enter higher education (13% reach college) and even smaller percentage (less than 3%) are able to make it to professional courses.

METHODS

Chronic problems faced by Indian education system (and also majority of highly populated developing countries) today can only be resolved by innovative use of technology. **Ezi Education** is a creative experiment to help underprivileged students in urban poor and rural areas of Gujarat (one of the state in India with population of 60 Million + people). Ezi Education project was conceived around basic premise of leveraging technology to create user friendly, mass centric, and economical solution to solve basic problems of inherent education system. The project aspires to universalize the education across India by making high quality science educational contents available to all hence bridging the opportunity divide.

The project comprises of two complementary initiatives, first being EziBox based Interactive Education Network and second being Ezi Education Channel. The end user can avail these services on a simple television (Accessible to 94% of people across Gujarat). It is India's first dedicated 24x7 channel providing science and mathematics education for 10th Grade students in Gujarati & English medium delivered by expert faculty on the Television at no cost to the students. To access the channel a student needs access to television with a local cable connection. The channel reaches to more than 2.5 Million homes across Gujarat.

EziBox works on a simple delivery mechanism. Contents (Video & Multimedia) are created in the studio. It is placed at student end connected to his/her Television or any kind of monitor. Contents are beamed to EziBox from Satellite Hub. Student receives contents in EziBox and views like a normal T.V. channel. Students can get solution of their queries via email or by calling toll free number while on every Saturday and Sunday, Live sessions are scheduled in which student can directly interact with teachers through EziBox. Student can even hear questions asked by other students and also watch the solutions given by the teacher for respective questions. EziBox has a feature to store a lecture so student can store any lecture and watch it as many time as he wants. Study Material of the respective lecture is being beamed to the EziBox before 2 hrs of every session, so that student can refer material before attending the session.

What makes EziBox more attractive is the fact that all of these are made available thru one device and that too on the existing Television of the users. EziBox, an End to End IP Box, will bring a host of customized applications, including Computing, Internet, Education, Social Networking, Entertainment, and High Quality Video Communication to name a few, on the Television Sets for the user.

RESULTS

EziEducation project makes it possible to

- Have interactive session on various subjects by expert teachers and professors from remote location, providing answer to coaching needs of students whether for school or any preparatory exam, reaching hundreds of students.
- Connect Rural Schools where teachers are scarce resource providing basic education services like primary education to children of all villages and other remote areas.
- Make rural schools more effective, by using virtual class-rooms which include live interactive sessions, multimedia teaching aid and pre-recorded content.
- Create knowledge communities where different groups and peers can learn and share knowledge, perception and ideas amongst them using cutting edge technology.

CONCLUSIONS

New emerging technologies and concepts like EziEducation will lead to new methodologies which will enhance the spread of education. EziEducation will leverage technology to not only eliminate inherent constraints in remote areas but also redefine the way education is delivered in urban areas through classical class-room approach. Thus, the benefits of latest communication revolution in providing education and training of desirable quality will change the way education is delivered in urban as well as rural areas. EziEducation is a beginning which can help:

- Remove Geographical Constraints in Science and Mathematics education
- Tackle Vital Issue of Scarcity of Quality Teachers & Faculty
- Make Education interesting and interactive for students
- Implemented Cost effectively

Extensive research is being carried out on how this next generation technology paves the way forward to better and more educational learning.

ABSTRACT

Science education is expected to integrate outreach projects into classroom learning. Constrained working memory capacity is a limiting factor: Cognitive load is supposed to be high at out-of-school learning settings especially if the project comprises hands-on activities. The main objective of our study was to identify potential relations of cognitive and motivational factors in students taking part in an interactive out-of-school lesson and thus, to enhance vital out-of-school science education. Central questions were: To what amount is our lesson designed adequately with respect to cognitive load parameters? How can general starting points for instructional optimisation be identified and characterised?

276 students (M_{age}=11.6$\pm$1.6) participated in the lesson illustrating properties of salt (NaCl). Content-related comparison and cluster analyses resulted in seven preknowledge/performance subsamples. Standardised mental effort and instructional efficiency allowed specific description of each subsample. Suggestions will be made how particular amounts of different kinds of cognitive load in working memory could explain these results. Motivational analyses confirmed and refined the classification. The results revealed possible implications for future out-of-school science instruction.

Keywords: *science education, out-of-school, interactive, cognitive load, instructional efficiency, instructional involvement*

INTRODUCTION

Out-of-school science education emphasises the need to integrate outreach projects into classroom learning (Hofstein, & Rosenfeld, 1996). The main limitation is the diversity of influence factors at out-of-school learning settings that mainly correspond to the novelty space (Orion, & Hofstein, 1994) resulting in enhanced cognitive load due to the novelty of an out-of-school learning setting. This is a critical point considering that students are expected to demonstrate clear cognitive achievements after participating in a curriculum-based outreach project. Cognitive load theory (Sweller, van Merrienboer, & Paas, 1998) differentiates between extraneous cognitive load due to layout/surroundings, intrinsic cognitive load due to complexity and difficulty of a task, and germane cognitive load as a result of learning processes. Extraneous cognitive load is supposed to generally be high at out-of-school learning settings. If a lesson comprises hands-on activities (e.g. science centres/out-of-school laboratories), this effect is exacerbated as these tasks are well-known to increase cognitive load. The application of cognitive load theory on instructional design should aim towards reduction of extraneous, fostering of germane, and adequate level of intrinsic cognitive load (Sweller, van Merrienboer, & Paas, 1998).

In our study, we developed an interactive out-of-school lesson following the principles of cognitive load theory. The lesson comprised simple experiments to illustrate essential properties of salt (NaCl). The project aimed to combine curricular topics with the inclusion of out-of-school experiences into scholar daily life. The main research questions were: To what amount is the lesson designed adequately with respect to cognitive load parameters? How can general starting points for instructional optimisation be identified and characterised?

For this purpose, we analysed subsamples of students with different preknowledge and performance scores. The main intention was to identify possible relations of cognitive and motivational factors in students taking part in an interactive out-of-school teaching unit. The aim was to evolve ideas for effective development of curriculum-based outreach projects, and thus, to enhance vital out-of-school science education.

METHODS

276 students (M_{age}=11.6$\pm$1.6) accomplished the out-of-school lesson. Five experiments illustrated freezing point depression, electric conductivity, endothermic resolving processes, density increase, and osmotic activity. Applying knowledge-tests, we measured preknowledge and performance. The students rated mental effort on an unidimensional seven-point scale (van Gog & Paas, 2008) each time after completion of a workstation. To develop subsamples according to preknowledge and performance, we conducted content-related comparison, followed by comparative cluster-analyses (c = 0.84). We compared standardised mental effort mean scores, instructional efficiency (van Gog & Paas, 2008), and motivational parameters (e.g. instructional involvement - Paas, Tuovinen, van Merrienboer, & Darabi 2005) of each cluster.

RESULTS

Content-related comparison and cluster analyses resulted in seven subsamples labelled according to pre-knowledge/performance: I-“low/middle”, II-“low to middle/high”, III-“middle/low to middle”, IV-“middle/middle to high”, V-“high/low to middle”, VI-“high/none”, VII-“middle/none”. Standardised mental effort and instructional efficiency scores allowed specific description of the subsamples (cf. Table 1). Motivational analyses confirmed and refined the results (cf. Table 1).

Table 1. Standardised mental effort mean scores, instructional efficiency and instructional involvement scores of each cluster, related to total sample average scores

#	I	II	III	IV	V	VI	VII
Mental effort	Below	Below	Approx.	Above	Approx.	Below	Above
Instructional efficiency	Above	Above	Approx.	Above	Below	Below	Below
Instructional involvement	Approx.	Above	Approx.	Above	Approx.	Below	Approx.

CONCLUSIONS

Suggestions will be made how particular amounts of the different kinds of cognitive load in working memory could explain the results. Students of cluster VII, for example, may experience too much extrinsic cognitive load due to the learning setting itself so that there may not enough capacity be left for learning processes (i.e. germane cognitive load). Calculation of instructional efficiency and instructional involvement – both parameters based on mental effort and performance scores – proved to be an appropriate method to analyse learner characteristics in an interactive out-of-school science lesson. We succeeded to characterise subsamples in a way that revealed 1) statements about the design of the lesson and 2) possible implications for future out-of-school science teaching. For example, our data emphasize the importance of adequate guidance.

A THEORETICAL FRAMEWORK BASED ON A CONSTRUCTIVISTIC REALISM FOR SCIENCE EDUCATION GOALS

Zahra Niknam

Tarbiat modares University

Z_niknam@yahoo.com

Khosrow Bagheri Noaparast

University of Tehran

kbagheri4@yahoo.com

ABSTRACT

The present research deals with philosophy of curriculum in Islamic Republic of Iran. It is argued that neither realism, understood as naïve realism, nor constructivism can provide a tenable basis for a proper philosophy of curriculum in science education. Instead, an alternative is suggested as constructivistic realism. While it is held here that there is a reality that science deals with, it is not the case that this reality can be achieved easily and directly. The only way is to use our constructs to capture the reality. These constructs are built by means of our imaginations as well as our values.

Key words: *Philosophy of curriculum, constructivism, realism, science education*.

INTRODUCTION

Epistemological foundation of curriculum and science education has been debated by two strong rivals, namely realism and constructivism. Realism, in its naïve version, holds that reality is separate from the knower in a clear-cut way and that the knower can aim at the way things really are. On the other hand, according to constructivist philosophy, knowledge is a matter of construction without being concerned with the way things really are. We have argued that both realism and constructivism fall far short of fulfilling the promise of providing a tenable basis for science education; the former by underestimating the role played by our constructs and the latter by leading to subjectivism. Our alternative view is a constructivistic realism that embraces both the roles played by reality and our constructs in dealing with the reality. This view presses on imaginations, feelings, values and beliefs of the knower in providing constructs that try to capture the reality. The proper and successful science has indications of both our constructs and the reality. Accordingly, science education should encourage students to listen carefully to reality as well as performing free imaginations.

METHOD

This article includes a theoretical inquiry and has, hence, used the analytical method to investigate on the epistemological presuppositions of the views on science education.

REALISM AND CONSTRUCTIVISM IN SCIENC EDUCATION

Realism in its naïve version holds on reality as an existing entity separate from the knower and that the knower should seek it in providing the true knowledge. Thus, knowledge is the discovery of external reality existing outside the bodies of cognizing beings and independent of them. Science is then conceptualized as a search for truths and a means for discovering theories, laws and principles associated with reality. Realists assume scientific knowledge as an objective and absolute knowledge which can transfer effectively from teachers' heads to students' heads. Students play a completely passive role in learning science. This view underestimates the roles that might be played by fore grounded presuppositions and conjectures in constructing science about the external or physical reality. Thus, in science education, learners, at most, are encouraged to observe objects, events and phenomena with an objective orientation in which imaginations, feelings, values, and beliefs have no proper place.

In contrast, constructivism asserts that knowledge doesn't refer to an objective or an absolute knowledge. Knowledge has to be viewed as a human creative endeavor which is historically and culturally conditioned. This view is shared by most schools of contemporary philosophy of science that subscribe to the thesis of theory dependency of observation. Accordingly, knowledge is by no means a representation of the objective world because it isn't independent of the knower. So knowledge is not passively received, but it is actively built up by knower. To show the total scope of constructivism, one should consider it as a spectrum with two ends of sociological constructivism and psychological constructivism. While the latter emphasizes on personal, individual and intellectual constructions arising from the activity of persons, the former maintains that scientific knowledge is socially constructed and vindicated. Faced with some critiques, it is said, especially with regard to the validity of knowledge, constructivism may lead to a kind of "anything goes".

CONSTRUCTIVISTC REALISM IN SCIENCE EDUCATION

In a research titled "A *study on the system of values and beliefs in The Islamic Republic of Iran, formulating a relevant philosophical foundation for curriculum*" (Bagheri et al., 2008), constructivistic realism is suggested as the relevant basis for curriculum in the country. This study is based on the findings put forth in a previous research about the place of philosophy of education in The Islamic Republic of Iran (Bagheri Noaparast, 2008) in which the epistemological foundations and principles of education is derived from Islamic teachings. According to the “constructivitic realism”, natural sciences are endeavors in order to know the reality of natural phenomena, but due to the complexity of reality, it is inevitable to make mental constructs and examine them and thereby provide evidence for their relevance to the reality. Thus, in science, both the reality and the scientist play their proper roles. This means that "epistemological foundations of education have two aspects: one related to the knower and the other to the known." (Bagheri Noaparast, 2007, p. 171). These two aspects of science are regarded in suggesting the view of "constructivistic realism". In this term, "realism" refers to exploratory dimension of science, that is to say, science deals with the reality of "something". Correspondence to reality, even thought not in its naïve version, is held as a criterion for the truth of knowledge claims. On the other hand, when science is considered from the side of the knower, constructive features of science come to the fore. Two major features that are related to this aspect of science are invention and correspondence with the human needs. As far as the invention is concerned, scientists are people make the science by means of their creativity and imagination in trying to understand the known. Also, correspondence of science with human needs refers to the role and involvement of scientist during the construction of science. This will show why and how scientists have selective views in doing science in order to resolve individual and collective needs. There isn’t any contradiction and conflict between the exploratory and constructive features of science. These two features are highly intertwined. Thus, science cannot be seen solely from either the first or the second perspective. To have a correct picture, we should take science as an endeavor to capture the reality by and in terms of our constructs (Bagheri Noaparast, 2007).

GOALS OF SCIENCE EDUCATION IN CONSTRUCTIVISTIC REALISM

According to constructivistic realism, science education has three main goals: 1) acquiring knowledge about natural phenomena; 2) acquiring insight about natural phenomena; and 3) acquiring skills to use and manipulate natural phenomena responsibly. The insight about natural phenomena comes from values and cultural presuppositions that might be inspiring in developing our constructs to capture the reality.

CONCLUSIONS

This article is part of a wider research on the philosophical basis of curriculum in The Islamic Republic of Iran. We tried to explain constructivistic realism as a proper epistemological view for science education**.** Constructivistic realism is different from both naïve realism and idealistic constructivism. Unlike the naïve realism, it does not hold on science as a definite and straightforward knowledge and contrary to constructivism, it tries to limit our imaginations and values by appealing to reality. Science must be seen as constructs that have already been justified, but one should not imagine that they remain immune to change. Constructivistic realism opens a space for more consistency between science and cultural values in society because constructs are held to be built by means of our imaginations as well as our values to capture the reality.

THE USES AND ROLES OF SCIENCE IN SOCIO-SCIENTIFIC DECISION-MAKING CONTEXTS

Jan Alexis Nielsen

University of Southern Denmark

jan@imada.sdu.dk

ABSTRACT

This presentation presents the preliminary results from a qualitative multiple-case study of Danish upper secondary school students' critical discussions on socio-scientific issues. The primary question to be elucidated pertains to the place and functional role of articulations of scientific content and arguments in group-discussions that aim at making a group decision on a socio-scientific issue. In a nutshell: how do students synthesize between natural scientific content and systems of values – or systems of interpretations of values (such as the ones found in the humanistic/social sciences)? The author recognizes as important the recent trends within the argumentation strand in international science education of shifting focus to the dialogic (as opposed to monologic) articulation of argumentation - i.e. the process of producing argumentative moves in discussion contexts. It can be argued, however, that a thorough theoretical framework for conducting such research within science education is only on the horizon. The analytic framework, which is applied in this study is constructed as a hybrid of the pragma-dialectical theory of argumentation and a set of basic tools originating from conversation analysis. As such, the data is approached through a critical-dialectical methodology.

Keywords: *Argumentation, Critical Discussions, Decision-making, Socio-scientific Issues*

INTRODUCTION

Informed decision-making is typically thought of as being a necessary feature of critical citizenry. To be sure, we find decision-making skills appearing more and more explicitly in (inter)national formulations of educational goals for upper secondary school. It is important to recognize that the concept of decision-making involves much more than "simply" being informed from multiple disciplinary fields such as the natural sciences. Decision-making processes are first of all highly complex processes that are neither easily spelled out nor easily taught explicitly (e.g. Ratcliffe, 1997), one reason for this is that being informed from multiple disciplines only forms the basis for a decision. Decision-making processes requires the argumentative articulation of that information as well as critical reflections upon such types of discourse. As such decision-making processes are argumentative processes in the broadest possible sense of that term. This presentation presents the preliminary results from a qualitative multiple-case study of Danish upper secondary school students' critical discussions on socio-scientific issues. The primary question to be elucidated pertains to the *place and functional role of articulations of scientific content and arguments* in group-discussions that aim at making a group decision on a socio-scientific issue. In a nutshell: how do students synthesize between natural scientific content and systems of values – or systems of interpretations of values (such as the ones found in the humanistic/social sciences)? The end-product of this study is first and foremost a semantic framework for future understanding and categorization of interdisciplinary argumentative discourse.

THEORETICAL BACKGROUND

The study applies a theoretical approach to argumentation, which so far has only been mentioned in science education: the *pragma-dialectical* theory of argumentation (Van Eemeren & Grootendorst, 2004). On this account, argumentation is treated as a regimented means to resolve a difference of opinion - i.e. as something that has *functionality* in resolution processes. Thus, rather than focusing on the structural coherence of, or patterns in, students' argumentation involving science, this study investigates the specific *functions*, which students distribute to scientific content (over and against the functions of non-scientific content) in the process of reaching a decision. The pragma-dialectician understands argumentation *as the performance of complexes of speech acts that play a role in a dialectical resolution oriented process* (a critical discussion) (Van Eemeren & Grootendorst, 2004). In accordance with dialectics the pragma-dialectician not only analyzes the argumentation advanced by one party in terms of logical coherence, but, more importantly, also against the background of resolving a difference of opinion (*ibid*). To this end, extensive methodological guidelines for general argumentation analysis have been produced. The core of a pragma-dialectical analysis is to *reconstruct* the discussion as a regimented procedure oriented towards resolution of disagreement; and this involves, among other things, analyzing the performed speech acts in order to make explicit (1) the fundamentals of the dispute, (2) the often implicit standpoints, (3) the commitments and entitlements of the parties, (4) unexpressed premises, (5) the structural aspects of the argumentation, and (6) which argumentation schemes are being put to use (*ibid*).

METHODOLOGY

The objects of this study will be group-discussions in 4 biology classes in the Danish upper secondary school (grade 12). Data will consist of the transcribed video recordings of the face-to-face discussions (n=12-15). The discussions are contextualized in a decision-making activity that revolves around the controversial socio-scientific issue "gene-therapy as treatment?" The activity will have length of 2x45 minutes and it will be the concluding activity in a longer course on genetics.

RESULTS

The data from each group are analyzed in 4 steps: (1) *Surface indexing*: A placement of markers in the discussion that locates local articulations of (meta-) scientific content. (2) *Local deep analysis*: A fine-grained pragma-dialectical reconstruction and analysis of the local dialectic processes of the discussion in which a (meta-) scientific content was articulated. (3) *Systemic analysis*: A global and coarse-grained pragma-dialectical reconstruction of the entire discussion dialectics towards the groups' decision. (4) *Synthetic analysis*: An analysis of the place and role of the local, (meta-) scientifically content-full dialectics within the global dialectics. The data analysis is dialectical in the sense that it is foreseen that reiterated cycles of step (2) and (3) are necessary for an elaborate synthesis in step (4). One very preliminary result from the initial analysis is that there is an indication that when propositions that contain scientific content are the object of explicit differences of opinion at the early stages of the discussions it is easier for the participants to structure their decision-making process at later stages in the discussion.

CONCLUSION

There are preliminary indications that it is possible and feasible to operationalize the pragma-dialectical framework for analyzing socioscientific discussions within the science education field. More elaborate ways of distinguishing between the different roles of science in discussions will be provided in the presentation.

ABSTRACT

This paper aims at presenting a collaborative research project where South African and Swedish science educators participate. Central in our working process are joint workshops held with the aspiration of developing strategies that would promote scientific literacy; specifically, developing strategies that encourage participation from 'new' groups, for example, in respect of social, gender, and cultural aspects. In this paper we will suggest approaches which will enable learners to develop their creative potential in science classrooms through writing, talking, arguing and doing science.

Keywords: *Scientific literacy; second language; social language; writing, talking, arguing and doing science*

INTRODUCTION

The promotion of scientific literacy is, according to Roberts (2007), a key issue in education throughout the world, and one reason for this concern is the aspiration of greater participation in science and technology education. Developing strategies that encourage participation from 'new' groups, for example, in respect of social, gender, and cultural aspects are a challenging but necessary enterprise. In a broad sense scientific literacy is argued on account of economic, utility, democratic and social/cultural reasons (Millar, 1996). The factors above suggests a need for a new approach to science education, one that takes into account both the fundamental and derived senses of science (Yore & Treagust, 2006), and which will enable learners to develop their creative potential through reading, writing, talking and doing science.

Policy documents in both South Africa and Sweden emphasise the ambition of increasing the amount of students participating in further science education; right now there is a falling trend. One suggested way that would contribute to the engagement from 'new' groups is to acknowledge the role of appropriation of science language in science learning, especially a second language. In a broad sense scientific literacy is argued with economic, utility, democratic and social/cultural reasons, and we suggest a need for a new approach to science education, one that takes into account both the fundamental literacy skills, for example, writing and talking in science language and the derived senses of science, for example, making informed decisions as participators in a democratic society.

In South Africa, science results are poor, partly as a result of the historic legacy of Apartheid and because of language issues. Teachers are facing a difficult task and are, generally, poorly prepared. Thus theoretically well-founded developments of the practice of teaching and teacher training are of utmost importance if the situation is to be improved. In Sweden, interest in science is declining, both as a career and as a body of knowledge. Understanding and developing alternate ways of supporting scientific literacy is crucial for changing this trend in general, and language issues are becoming increasingly important, not only in South Africa, but also in Sweden where an increasing number of students have Swedish as their second language.

In South Africa the Department of Education has attempted to address the issue of developing scientifically literate learners via its recently developed National Curriculum Statement. The Natural Science Learning Area of the South African curriculum focuses on three 'Learning Outcomes': scientific investigations, the construction and application of scientific knowledge, and an appreciation of the interrelationships of science, society and the environment; areas which will form one of the core issues in this project.

The Swedish curriculum states in its first chapter that in terms of the compulsory school phase "The school has the task of imparting fundamental values and promoting pupils' learning in order to prepare them to live and work in society" (National Agency of Education,1994). The role of every subject is to support this aim and when it comes to science studies the syllabus is divided in three parts: knowledge of nature and Man, scientific activity and use of knowledge. This is a reflection of science as the products of science, the processes of science and the social implications of science. As such, both the South African and Swedish curricula call for learner development in scientific literacy (and concomitantly in teacher development). Nevertheless, indications are that in both these countries, and generally internationally, there has been but a slow awaking in terms of research findings in the fertile ground of scientific literacy, and very little practical implementation (Yore & Treagust, 2006; Roberts, 2007)

METHODS, RESULTS AND CONCLUSIONS

The South Africa/Sweden project collaborative efforts focus writing, talking, arguing and doing science, and the paper will discuss the aspects that we, so far, has focussed on: scientific investigations (doing science), use note books (writing science), and argumentation skills (talking and writing science). Central in our working process are joint workshops held with the aspiration of developing strategies that would promote scientific literacy; specifically, developing strategies that encourage participation from 'new' groups, for example, in respect of social, gender, and cultural aspects. In this paper we will suggest approaches which will enable learners to develop their creative potential in science classrooms through writing, talking, arguing and doing science.

Doing a scientific investigation, in brief, includes choosing an investigable question, formulating a hypothesis, perform the investigation and draw a conclusion. The procedure is documented in, for example, a note book where all steps are argued for (Webb, 2009). Argumentation, understood as connecting claims with evidence, is an important part of doing an investigation, and is a potentially influential skill in both the fundamental and derived sense of scientific literacy. Furthermore, we suggest that promoting code switching is essential – both between first and second language, and between social languages, principally colloquial and scientific languages (Olander, 2010).

ABSTRACT

Liquid crystals are materials which are used in displays, phones, laptops, mp4 players etc. Although these materials are so common, occasional debates with students showed that they are aware of their existence but not much more. As liquid crystals are a potential topic to be introduced into curricula in future, we assessed the informally obtained knowledge of students who had finished secondary school education. The paper-pencil questionnaire comprising 31 items was completed by 448 first-year university students at the beginning of the academic year 2009/10. They were asked about general concepts related to the state of matter, a few general questions related to liquid crystals and a few more elaborate questions about their properties. The results show that 2/3 of students are not familiar with liquid crystals. In this paper the item analysis and the detailed analysis of the results with respect to conceptions of different groups of first year university students (pre-service science teachers, pre-service primary school teachers, etc.) are presented. According to the results of this study, the teaching unit was developed (see the presentation Ziherl *et al*., 2010).

Keywords: *liquid crystals, students' conceptions, knowledge self-assessment, misconceptions.*

INTRODUCTION

One of the main problems in Europe is the lack of motivation for science and technology studies. The main problem is that usually the school chemistry and physics studies have little in common with students' experiences from everyday life. A possible way to motivate them is the introduction of contexts in which chemical and physical concepts are connected to the daily life of students. These context-based approaches aim to bring the students' learning closer to their own experiences, and share characteristics that make the learning of science more meaningful (Bulte *et al*., 2004).

Liquid crystals are relatively exotic materials that have the properties of liquid and crystal at the same time. They have interesting properties for applications and therefore they are widely used in displays, phones, laptops, mp4 players etc. Liquid crystals can be a rich source of context-based units in chemistry and physics (Brown, 1983; Wright, 1973).

Unfortunately today, liquid crystals are not even mentioned within the chemistry or the physics curricula in secondary schools. Even though they do not learn about them in the school, we expected that students would obtain some knowledge about them through informal education. Therefore, the main purpose of the study was to assess secondary school students' conceptions about the liquid crystals.

The research questions (RQ) that were considered in our study were:

RQ1: What was the students' achievement on the LCQ regarding their self-assessed knowledge about liquid crystals?

RQ2: What is students' conception about liquid crystals after finishing secondary education?

RQ3: Do students who study chemistry or physics, other natural sciences or social sciences differ in their conceptions about liquid crystals?

METHOD AND RESULTS

448 first year university students (they have recently finished their higher secondary education) participated in the study. 15 % of students study chemistry or physics, 16.5 % other natural sciences (biology, home economics, computer science, and mathematics) or technology subjects and 68.5 % of students studied social sciences. Students come from mixed socio-economic backgrounds.

A 31-item paper-pencil questionnaire (LCQ) about liquid crystals was applied in October 2009. The questionnaire consisted of three parts: the general part, the motivation part and the part related to liquid crystals with 17 items. The part concerning liquid crystals had 4 general questions related to the soft matter, 4 questions of general knowledge about liquid crystals and 9 questions related to deeper understanding of phenomena related to them.

RQ1: About two thirds of students have not heard about liquid crystals yet, and 73 % of students think that their knowledge about liquid crystals is negligible. The independent samples t-test shows that there is a significant difference in achievement on item, that evaluate students' conceptions about liquid crystals between students who self-assess their knowledge about liquid crystals as moderate ($M = 4.9$; $SD = 2.5$) or negligible ($M = 3.2$; $SD = 2.4$); ($t(435) = 6.52$; $p \leq 0.000$)

RQ2: The results show that students' conceptions about liquid crystals are weak. Students achieve only 3.6 points ($SD = 2.6$) on average out of 17 on the items testing their conception of liquid crystals.

RQ3: One way analysis of variance (ANOVA) shows that there is no significant difference between students who study chemistry or physics ($M = 3{,}66$; $SD = 2{,}502$), other natural sciences ($M = 3{,}88$; $SD = 3{,}088$) or social sciences ($M = 3{,}51$; $SD = 2{,}420$) in their knowledge about liquid crystals ($F(2, 445) = 0.65$; $p = 0.521$).

CONCLUSION

Despite the fact that the liquid crystals are common in everyday life, students have very limited knowledge about them. Most of the students who had heard about liquid crystals relate them to displays. Our results show that further work on this interdisciplinary topic, which should be carefully included into physics and chemistry curricula, is worth the effort (see abstract Ziherl *et al*., 2010).

SMOKING DURING PREGNANCY: STUDENT´S JUSTIFICATIONS AFTER A PROBLEM-BASED LEARNING MODULE ON RESPIRATORY AND CIRCULATORY SYSTEMS

Franco Pirrami

University of Camerino - Italy

franco.pirrami@unicam.it

Agnaldo Arroio

University of São Paulo - Brazil

agnaldoarroio@yahoo.com

ABSTRACT

The aim of this study is to investigate how students give scientific based justifications after having experienced a problem-based learning activity regarding the respiratory and the circulatory systems. The scenario used was related to smoking consequences. Along six weeks, students in three classes of Italian compulsory secondary schools used the problem-based learning approach. After five months they were asked to write a text to give suggestions regarding a behaviour related to cigarettes smoking. Results show that the majority of students use anatomy or physiology concepts to justify their suggestions.

Keywords: *health education, secondary school, problem-based learning, justification.*

INTRODUCTION

Health Education is a life-long process that helps people to make informed choices towards healthy habits (Katz & Peberdy, 1998).

Adolescence is a critical period for engaging the population in health as new behaviours are laid down and influence lifelong health (Viner & Barker, 2005). Sensation seeking makes adolescents more vulnerable to nicotine, alcohol and drugs addiction (Martin *et al.*, 2002).

Knowledge of the physiological processes and awareness of the consequences that behaviours have on one’s own health might encourage people to avoid unhealthy habits.

As I don’t consider an effective educational strategy just preaching what is good or not, I chose to use Problem-based learning (PBL) approach (Barrows, 1998). Thus, starting with a scenario, students could get more interested in exploring the topic, in researching about it, and in discovering consequences of unhealthy habits by themselves.

Such an approach based on problems/scenarios drawn form real life is also at the base of the development of students’ justification and argumentation skills (Jiménez-Aleixandre, 2008).

OBJECTIVE

The aim of this work is to investigate how students justify their suggestions about smoking effects after having dealt with a PBL approach regarding respiratory and circulatory systems.

METHODS

TIMING, PARTICIPANTS, AND ACTIVITIES

During November and December 2008, 64 students in three classes of Italian compulsory secondary schools (15 to 16 years old) experienced a PBL approach to deal with circulatory and respiratory systems. The module lasted six weeks, with two hours lesson per week.

At the beginning and during the module inputs related with smoking components and effects were given to students with the aim of promoting a discussion among them. The discussions were never preceded by teaching scientific contents and students were induced to search for information regarding anatomy and physiology of the respiratory and circulatory systems which could explain smoking consequences. Information was then presented and collaboratively elaborated with the tutor's contribution, first, in small groups and, then, at the class level.

In May 2009 students were asked to write a text in which they had to give suggestions to a friend who was a pregnant smoker.

DATA ANALYSIS

The evaluation of justifications given by students was done establishing four categories and three sub-categories that are shown in tables 1 and 2.

Table 1. Categories used to classified justifications

1	No explanations are given about how substances pass from the mother to the foetus
2	Explain that substances pass with/through blood but do not use any other anatomical or physiological concept
3	Explain the passage of substances from the mother to the foetus using one or more concepts on anatomy of the respiratory and/or circulatory systems
4	Explain the passage of substances from the mother to the foetus using one or more concepts on physiology of the respiratory and/or circulatory systems

Table 2. Sub-categories used to classified justifications

A	Substances and consequences are mentioned
B	Only substances, but no related effects are mentioned
C	Substances are not mentioned

RESULTS

One third of the students give justifications according to category 4, one third according to category 3 and the remaining are equally divided between category 1 and 2. Students who gave justifications using anatomy and physiology concepts also mentioned smoking components and effects (sub-category A) more than students who gave simpler or no justifications. Some examples of answers are given below.

4.A - "…substances pass from the mother to the foetus through the blood… Carbon monoxide bind with haemoglobin with an irreversible bond and this prevent the bond between oxygen and haemoglobin. This leads to a lower oxygenation of tissues and can cause several problems, as underdevelopment of the foetus… Another substance is nicotine which is the cause of addiction…".

3.A – "…smoke components, as carbon monoxide, go through the pharynx and the bronchioles and they reach the alveolus where they pass into the blood... The mother exchange substances with the foetus via the placenta, so substances contained in the blood reach the foetus… smoke components can induce malformation and cancer in the foetus…".

2.B – "…the foetus is in connection with the mother and substances, as carbon monoxide and nicotine, pass through blood form the mother to the foetus.".

1.C – "…if you smoke is like if your child were smoking, as the substances that you breath-in reach the foetus and produce several damages to his health.".

CONCLUSIONS

When students are stimulated with a real life problem they can acquire knowledge that is retained at least for some months. Most of the students that have acquired scientific knowledge with a problem-based learning approach are able to use it to justify their claims.

ABSTRACT

In this paper the objectives of education in views of Jaspers and the role of virtual education in them was studied. Jaspers believes that educating learners as useful members of community means, on one hand, preparing them for future life and job provided by virtual education and on the other hand, it means reviving and fostering traditions of that society to learners through day to day life, manner of speaking and social encountering like contact with human character of a teacher. Therefore, the virtual education can not be replaced face to face education. Finally some applied implications have been mentioned.

Keywords: *Virtual education, Information Technology, Social objectives of education, Jaspers*

INTRODUCTION

With attention to the importance of education and its role in the whole of human life and destiny, it is necessary alongside virtual education technical development, the role and its consequences on the whole education process and human life will be investigated.

Thoughts and questions about the technology date back to Greek, but by development of new technologies in the nineteenth century, and enveloping it in the twentieth century, philosophical questions of this technologies also has been spread and philosophers such as Heidegger(1977),for instance, less or more have evaluated technology and information technology and its consequences. Among the philosophers who have studied new Technologies the role of existence philosophers is more prominent and fundamental.

On the other hand, Jaspers (1956, 1957, 1963 and 1969), one of the main representatives of the philosophy of existence, have some ideas as educational philosopher. In the present study his ideas regarding the education and the relationship of virtual education with that are investigated. It seems that, on the one hand, education has a kind of communicational and social nature. On the other hand, Jaspers considers that "being self" and "becoming self" to be possible only on the basis of communication (1969). Therefore, social objectives of education can be investigated from the view points of Jaspers. Based on this fact, first some of the social objectives of education are deduced with regard to the Jaspers views and the role of virtual education in the achievement of these objectives are studied.

RESULTS

In the study the relationship between the virtual education and some of the social objectives of education were examined from the view of Jaspers.

Jaspers makes difference between "community" and "society" and believes that educating learners as useful members of community means, on the one hand, preparing them for future life, job and on the other hand, it means awakening, preserving and fostering the traditions and the genuine historical culture and soul of that community in students through day to day life, manner of speaking and social encountering like face to face contact with human character of teacher that Jaspers (Graic, 2000) calls "existential relation". He claims that "being self" and "becoming self" is possible only based on such communication; communication with others, traditions, culture and history. Jaspers in his emphasis on the role of communication in human evolution, even in the lowest level of life which is the ordinary life, refers to the deaf kids that were considered as dull before the creation of the sign language, but by the creation of the sign language as a communication device, the inaccuracy of the theory and the role and significance of communication were revealed (1963). Furthermore and Like Kierkegaard, (Prosser and Ward, 2000) it seems that we can introduce authentic person in relation to authentic community: authentic community knows its past and depends to it and so people have opportunity to conscious about the past of their community and connect to it.

Virtual education in connection with the first aspect, (preparing students for future life and job), has provided abundant opportunities: Nowadays, the easy and fast access to the information has, has moderated the extensive need for it and also has helped in saving the time for gathering information and so has accelerated the process of scientific production. As the consequence, the quality of the material life has increased. Every day the learners witness the achievements of Information Technology such as freeing human from illnesses and enriching his life with learning, art, sport, and recreation. As an example, we can mention the extensive virtual education that has facilitated the learning of such scientific skills as driving and piloting.

But alongside these achievements, virtual education also has changed the life pattern of teachers and students. For example, they rather communicate face to face, for their informational and even social needs, communicate virtually such as chat and email. Spreading the process is a challenge for the second aspect, i.e. awakening, preserving and fostering the traditions and the genuine historical soul of that community in students.

CONCLUSIONS

So the educational systems should train the teachers who are representative of traditions and authentic historical culture of that specific community. It should also provide the context for interactions between the teacher and learners in the school and community in order to animate the community's traditions and culture in the students and supply the ground for preserving and growing them.

on the foundation of research findings and by accepting the priority of the question concerning technological paradigm than question concerning how reforming by using it some applied implications as follow up virtual education beside face to face education and emphasis on holistic view than unilateral one in using virtual education have been mentioned in conclusion part of this paper.

INFORMATION AND COMMUNICATION COMPETENCE OF BIOLOGY TEACHER IN THE FACE OF SOCIAL AND EDUCATIONAL CHANGES

Katarzyna Potyrala

Pedagogical University of Cracow
Institute of Biology

potyrala@up.krakow.pl

Alicja Walosik

Pedagogical University of Cracow
Institute of Biology

alice@up.krakow.pl

ABSTRACT

Education must constantly be adapted to new needs. Educational tasks determine new styles of teachers' work and also their competences, showing that the effects of the course of didactic process depend on the teacher's awareness to a large extent, way of understanding of the school's reality and the students themselves. Currently the media are ever-present. Mass media and hypermedia shape new patterns and new values. In the article the attempt to answer the question: "What kind of biology teachers' competence are necessary in connection with the social changes?" is undertaken. The survey research among 45 biology teachers was conducted.

Keywords: *social changes, information, communication, teachers' competence*

RESEARCH METHODOLOGY

The following objectives have been specified: 1/ formulating general, theoretical assumptions of teaching training with use of different ways of communication, 2/ studying aspects related to functioning of the models of didactics communication and mediation as instruments for formulating metacognitive strategies in students. Research hypothese: In view of the social and educational changes the priority is defining a canon of new teachers' skills and deeper understanding philosophy of the reform. It means mainly: metacognitive competence and ability to use the dialogue ICT-aided strategies. 45 biology teachers participated in the survey research and in the attempts of modernizing educational process. One part of the research concerned the self-evaluation of creative and informative competence. Second one was connected with the analysis of the teachers' activities connected with the practical application of different form of communication (tasks) during ICT-aided biology postgraduate studies. The research was also connected with the analysis of the curriculum and teaching standards at university level.

RESULTS

The results put main attention on the fact that system of ICT-aided biology and environmental teachers' education is partly adapted to the requirements of information society. The realization of teaching aims partly need help of technology and cooperation, some part of teaching contents need only the ability of information gathering and communication understanding as a simple data transmission. The results confirm the authors, views that necessity of the changes is connected mainly with the fact that ICT and subject education has too small number of links and such skills as critical and alternative thinking aren't sufficiently educated with thought about their utilization in contemporary world of media and technology, permanent education and metacognition.

CONCLUSIONS

New canon of teachers' competence must take into account training needs, teachers' and students' individual learning style, strategies of dialogue, work in collaboration. It means preparing teachers to new role: facilitators of students' learning and mediators of different scientific problems. Teachers need pedagogical content knowledge on the role of ICT tools in the respective disciplines and how that influences how we formulate learning objectives (Louka & Constantinou, 2007).

ABSTRACT

In this contribution we present different types of questionnaires designed for evaluation of educational process of Biotechnology course, which had been performed within the study of Food science and technology at Biotechnical Faculty at University of Ljubljana for 20 years (from 1989 to 2009). Students' opinion regarding realization of that course was a useful tool for applying some improvements of educational process and furthermore, delivered a platform for later development of biotechnology studies.

Keywords: *biotechnology, education*, *questionnaire*

INTRODUCTION

Biotechnology is a very fast developing field in bio-technical and also in sociological dimension (*Raspor et al., 2000*). For that reason, biotechnology education is exposed to extremely fast and profound changes, which have to be followed by up to date courses which can deliver new knowledge and skills to students very fast after discoveries and their implementation to practice. This is one of the reasons why teaching methods and subjects have to be implemented regularly and fast to cope with changes in this field. Ignoring this fact, it would mean that out of date knowledge and skills will be delivered to students and practice will not accept them with sympathy and enthusiasm. Biotechnology study at University of Ljubljana started at postgraduate level in 1993/94 and continued at diploma level in 2003/04 (*Cedilnik et al., 2003*). In a meantime, majority of biotechnology education was going on through a basic course of Biotechnology within the study of Food science and technology at Biotechnical Faculty at University of Ljubljana, as it is also common at other European universities. Managing education success and teaching outcome is important tool among performance indicators in higher education. Some schools are focused chiefly on research outputs. They ignore the teaching function of universities. This paper outlines the development of a student evaluation instrument designed to measure the teaching performance of basic academic organisational units, which is at our university the Chair. The theory of teaching and learning that underlies the course experience questionnaires is described in continuation. The instrument's statistical qualities and its ability to discriminate intelligibly between different courses and topics are discussed in the context of education.

The principal conclusion reached in the last years is that the questioners offer a reliable, verifiable and useful means of determining the perceived teaching quality of academic units in systems of higher education that are based on combination of teaching models and teaching practices. There is always permanent question about purpose of the evaluation? It could be an evaluation of the quality of the educational product. This could be focused on the whole programme, a course, a module, a class (lecture, seminar, exercise, etc.) on one side or the performance of the programme providers like the academic staff, tutors, support staff, chair. Finally, the actual knowledge or experience of the students as partners in the process can be assessed as well as their experience, motivation and approach to learning. Our students had been constantly evaluated about their opinion regarding education in biotechnology. Their responses were a useful tool, which helped a lot not just in evaluation of course improvement, but also delivered platform for later development of regular studies in Biotechnology and offered possibilities for improvements of Bsc (*Raspor, 2006*) and Msc courses (*Raspor, 2007*). This approach was found out as good attitude for better teaching and higher success of knowledge and skills transfer.

METHODS

We developed a **special questionnaire**, which was applied for more then decade and gave an excellent overview about transformation of students' perception of Biotechnology knowledge and skills as well as teaching methods in this area. Since we also have regular evaluation with **official questionnaire**, which is performed yearly by Biotechnical Faculty, suitability of both questionnaires for that purpose can be easily compared. Official questionnaire is comprised from five questions mostly assessing teachers' or assistants' characteristics in following domains: Quality of lectures/exercises/seminars, Stimulation of discussion, Relation to students, Accessibility for help and discussion. Special questionnaire contains 22 questions that are considering following issues:

- the clarity of the stated educational aims and learning outcomes
- the realism of stated pre-requisites/prior knowledge
- the curriculum and its content - perceptions of relevance/usefulness
- the way in which the curriculum was presented or delivered
- the development of subject-specific skills
- the development of non-subject specific (personal and/or transferable) skills
- the appropriateness of the methods of assessment
- the appropriateness of the style of teaching and the performance of teacher
- the quality of feedback to the student on the performance of the student
- the motivation/attitudes of the student
- the educational challenge presented to the students
- the workload, how reasonable, how realistic
- the support available to students/course books/resources for independent learning
- the effort made by the student, and the take-up of support/guidance
- the overall experience of the student of the teaching and support for learning

RESULTS

The special questionnaire gives more information to teachers and assistants for improvements of the course at different levels: attitude, motivation, overlapping with other courses and already gained knowledge, as well as a relation between teacher and students. On the other hand, it is quite time-consuming. For that reason, we coined in recent years a

horizontal screening questionnaire, which is user-friendly for teacher and students. It takes much less time for responding and evaluation, however, it can not deliver the same quality of information. The official questionnaire gives some figures, which can not be easily correlated to the course, it's subject and realization mode.

CONCLUSIONS

One can conclude that special questionnaire is a more suitable tool as the official questionnaire. However, all questionnaires are useful tool for teacher because of students feedback, they are useful for students because they realize the importance of their attitude for gaining new knowledge and skills and it is important for chair (group), because it can help in developing new teaching tools to enhance knowledge transfer. We can also not ignore the fact that new technologies do not always follow traditional technical rules and for that reason communication of new achievements in the frame of public perception shall not be ignored.

THE COMPLEX DYNAMIC OF THE LEARNING ACTIVITY

André Machado Rodrigues
University of São Paulo, Brazil
andremr@if.usp.br

Cristiano Rodrigues de Mattos
University of São Paulo, Brazil
mattos@if.usp.br

ABSTRACT

Individual's concept meanings development goes beyond a process that deals with the dynamics of internalization of relations among the elements of the living world, i.e. person's cultural-historic milieu. The internalization of concepts is associated with the attribution of words meanings, which are used in specific contexts. Understanding the mode persons become conscious of words meanings, allows comprehend, during formal teaching, how discursive interactions can contribute or not to learn the meanings of the words teacher would teach. In this work, through a theoretical investigation, we related the socio-cultural processes to the persons' cognitive changes. In order to deal with this problem we related Vigotski's internalization concept and Mortimer's conceptual profile model within Leontiev' Activity Theory. We understand that the teaching-learning process is composed by different structuring levels, whose hierarchies are defined by the degree of complexity of the dynamic interaction in the ZPD. This situation demands negotiations of meanings between peers that use their conceptual profile zones. In this sense, the proposed a model relating the mental representations –conceptual profiles – and the complexity of living world. Here the teaching-learning process is constituted by the articulation of the several levels of representation in a social interaction field of living activities.

Keywords: *Internalization, context, activity theory, conceptual profile*

INTRODUCTION

The concept of internalization has been pointed out in recent cultural-historic investigation approaches, mainly because it is a concept that relates subjects' external world to subject's internal processes, such as the development of superior mental functions. In this sense, understand internalization process is to understand the teaching-learning process, also in its formal or informal mode. Our discussion introduces the concept of internalization from the point of view of complex systems. Within this theoretical perspective, we can deal with internalization as a complex dynamic process, composed by interactions among several hierarchal levels that are retro-feeding. We start from a discussion about the relation between concept learning and context, trying to observe the dynamic aspects of the teaching-learning process. In this way we took as base Rodrigues and Mattos's (2007) extended versions of Mortimer's (1995) conceptual profile model. We present a learning model as a conceptual profile evolution process in the teaching-learning activity.

It seems obvious that to represent the complex dynamics of the world, the conceptual profile zones should have an associated complex dynamic that allows learning the continuous context changes to which subjects are submitted. It is necessary to consider that individuals evolve psychological and cognitively as a function of a learning process, through a dialectical interaction with his/her social-historical context (Vigotski, 2001).

In this work we propose a model to describe the process of conceptual profile zones evolution in the learning activity. We see the teaching-learning process as a composition of different structuring levels, whose hierarchies are defined by the degree of the complexity of the dynamic relation among the concepts that are internalized. This model helps us to mark a conceptual profile dynamics related to the profile zones, as well to the possible relations among different profiles. In this perspective, we associate the learning with the activity through the process of internalization and generalization (Leontiev, 1978).

FRAMEWORK

To deal with this assumption we use the Activity Theory framework (Leontiev, 1978). We correlated the mechanisms of evolution of the conceptual profile with aspects of the learning activity, using Rodrigues and Mattos (2007) learning orders as markers of the conceptual profile dynamic process.

To Leontiev (1978) the development of the conscience is a private internal activity generated by the dynamic of the human activity, and vice-versa. This process is mediated, at the same time, by the work instrument as well as by the society. All human activity has a motive, which has origin in the individual's (or group's) needs. The activity is composed by a set of actions performed by individuals (or sub-groups) that disjointedly does not lead directly to the possession of the needed object. The actions have specific ends that do not coincide, necessarily, with the motive of the activity, but jointly they constitute the activity. In short, the activity is composed by actions that are composed by operations. These aspects have the same structure therefore we should be able to distinguish, in the cognitive activity, actions from operations. The appropriation of a socially built content, whose meanings are expressed through words, is an interior activity. Then learning is characterized by the internal activity of appropriation of contents embodied with individual's sense. Leontiev (1978) considers that the appropriation of practical and cognitive human actions goes beyond the process denominated "internalization of external actions" (p. 184). These gradual transformations of what is external into internal, happens while students live in the activity. These transformations come from the need of human's knowledge acquisition and it is conditioned to the significations refraction through the prism of the widespread experience of the social practice. The refraction of the phenomena or concepts in its signification can be understood as learning in context.

Thus, there is an organization of actions and operations articulated in several hierarchical levels that, depending on the observed activity, can be interchanged, that means, actions can be seen as operations and vice-versa. More articulated compositions, of activities in actions and operations, reveals the complexity of the cognitive structures of representation and of the human activity.

THEORETICAL SYNTHESIS AND CONCLUSIONS

Our interest, from this theoretical framework perspective, is to understand the communication process in the teaching-learning process of scientific concepts in Science classrooms. This hierarchical organization can be exposed in the Newton's second law problem solving activity. To understand how Newton's 2^{nd} law formula and its Physics content become an operation (or action) in a problem solving activity, it is necessary to decompose the activity in elementary actions and operations, its basic structure (conceptual profile hierarchies). The same rationale could be applied to the hierarchies of the Physics concepts: acceleration, mass and force that become operations in the problem solving activity. Each one of these concepts has countless inexplicit hierarchical levels of operations (notions of time, space, displacement, inertia, vectors etc.). Besides considering each element isolated, we must consider their composition, the complete expression that, to superior hierarchical levels, stops being an action to become an unconscious operation in the resolution of more complex problems, including more complex conceptual profile such as “problem”, “solving” or “learning activity”.

The activity, the actions and the operations that students and teachers carry out converge in the construction of a context where the educational activity happens. It is where the teacher can contribute, as a more capable peer, to the students’ scientific concepts formation, negotiating meanings and driving then towards an appropriate context, which motivates the achievement of the learning activity.

It is fundamental the idea that students’ learning is a vital process that happens during their whole life, including science and technology immersed in socio-political environment where values are confronted, even at the school situation. The internalization of specific conceptual profiles zones in the school life is a stage of the development process of that concept (Vigotski, 2001). Therefore, we can attribute to the school the role of promoting the consciousness that the learning process lasts for the entire lifetime. In this sense learning and development represent the dynamic of the conceptual profile in all its dimensions - epistemological, ontological and axiological (Rodrigues & Mattos, 2007).

It is very important to know in which learning order the student is, regarding a specific concept, so the teacher can establish pedagogic actions that make students conscious of the meanings’ limit of his/her utterances in other contexts as quotidian contexts. For this reason, it is important that the teacher be aware of these stages and understands that it is essential to clearly define the context where the concept he is willing to teach, have the appropriated meaning. This action is part of a social interaction state (ZDP) and a teacher/student cognitive state –conceptual profiles– that belongs to the context meaning negotiation.

PATTERNS IN PUPIL BEHAVIOUR WHEN USING CHEMISTRY SIMULATIONS: INTENDED DESIGN AND REALITY OF ACTION

Susan Rodrigues

University of Dundee

s.roddrigues@dundee.ac.uk

ABSTRACT

This paper reports on pupil engagement with simulations that are indicative of those commonly available to school science: practical experiments or simulations depicting microscopic chemical interactions. The project included a phase involving 14-16 year old pupils and used a retrospective accounts methodology (Clarke, 1998) to access their explanations. The second phase involved monitoring online behaviour while pupils aged 12 to tertiary aged students used the simulations. A digital record of their pathway data documenting their behaviour was obtained and analysed. This paper reports on the nature of the behaviour observed and offers explanations for particular actions.

Keywords: *Simulations, chemistry, school and tertiary students.*

INTRODUCTION

Rodrigues (2009) has documented the potential of various computer-based technologies for science education. Much of this potential is guided by a belief in the power of computer based technologies to motivate pupils and is guided by a suggestion that goal orientation, interactivity and feedback empowers pupils and produces enhanced learning outcomes (Leach, and Moon, 2000; Löhner, Van Jooligen and Savelsbergh, 2003; Stief and Wilensky 2003; Ardac and Akaygun, 2004; Lagowski, 2005).

METHODOLOGY

There are two phases to this project. The first involved a small cohort using simulations and a retrospective methodology being deployed. In the first phase the pupils were filmed as they used the simulations, these records were played back to them and they were asked to explain their documented behaviour. The second phased involved pupils from several schools and students doing chemistry in one tertiary institution. This cohort had their online behaviour tracked and recorded. We then analysed the patterns of behaviour observed and recorded.

SIMULATIONS

The project selected simulations from this website that were representative of many commonly found types of simulations used in science lessons in schools. Two types of simulation, typical of many commercial products, in terms of their appearance, their quality and their purpose, were impressive from a teaching perspective. They reflect realistic experiments, they provide opportunities to conduct experiments without incurring costs for equipment or resources, and they allow for multiple repeat experiments. From a teaching perspective the microscopic representations provide an opportunity to animate what has until recently only been shown as static models in textbooks, or as ball and stick models in classroom demonstrations. On the website, some of the simulation also have tutorial worksheets. However, for the purpose of this project, the simulations were used without accompanying worksheets. In this paper we present findings that pertain to the titration simulation. Acid base titrations are common experiments undertaken in school chemistry (Sheppard, 20006).

FINDINGS

There were several interesting findings with regard to perception of ease and reality of recorded behaviour. This paper discusses some of these findings.

PHASE 1

Though most of the pupils were unable to carry out the titration because they relied on their prior knowledge and discounted the instructions available, those who had undertaken titrations in the past, were able to clearly explain the process, their intentions and their science understanding for the reaction. This would suggest that the pupils' information processing skills rather than their chemistry was being tested by the simulation.

PHASE 2

Our sample suggests that on the whole the titration simulation was seen to be as interesting (64%) as a computer game. Of the thirteen 18 year olds (university students) in the sample only three (23%) thought the metal simulation was not as interesting as a computer game. In contrast, 40% of the 12-13 year olds, (6 of the sample of 15), 60% of the 14-15 year olds (9 of the sample of 15) and 46% of the 16-17 year olds (5 of the sample of 11) thought the simulation was not as interesting as the computer game. So, given that the University students were all studying chemistry through choice, perhaps it was the subject matter rather than the simulation that rendered it interesting. However, this is purely conjecture as we did not ask for their reasons for interest. The data from our phase 2 sample also suggests that the titration simulation was perceived to be easy (82%). While one of the eighteen year olds and none of the 12 –13 year olds thought the simulation was not easy. Overall a high percentage of students found the simulation easy and only 3% did not think the titration simulation was easy. However, our preliminary analysis suggests that student perception of ease and interest was not necessarily found in their performance as they used the simulation and in their responses to questions based on their understanding.

CONCLUSION

The findings from this project suggest that e-assessment involving the use of multimedia or symbolic representation in science education will have to take great care if it is to ensure that what it is assessing is the pupil's science capability and not information processing skills, that rely on shared symbol identification or on the ability to follow the designers' logic of instructions. We must ensure that symbolic representations used in multimedia software does not assume that the pupils will assign meanings to symbols as intended by the designers.

ABSTRACT

The purpose of this study was to implement the preliminary findings from a study entitled "Survey of Teachers' and Students' Opinions on Learning Ethics in a Science Classroom" to an actual science classroom. The preliminary research showed that 37.9 percent of students rated their level of understanding of ethics in science as high or very high. In addition, 66.3 percent thought that they are interested in studying ethics in science. Additionally, hybrid learning which is the combination of face-to-face and web-based learning can be an appropriate pedagogical method of learning ethics in science. This study is a mixed method research. Pre-and post-test, questionnaire and focus group interview were used. The sample group was 24 (9 females and 15 males) grade 10 science students from Mahidol Wittayanusorn School in Thailand. Students' awareness and understanding on ethics in science, thinking skills, and communicative skill were assessed. Also, hybrid instruction was evaluated. It was found that students' awareness and understanding were increased as well as thinking and communicative skills. In addition, students reported that they were satisfied with the hybrid learning they experienced, even though some improvement is needed. These findings will eventually be offered for use of other schools in Thailand.

Keywords: *Ethics in science, Hybrid Learning*

INTRODUCTION

Ethics is concerned with what is right or wrong, good or bad, fair or unfair, responsible or irresponsible, obligatory or permissible, praiseworthy or blameworthy. It is associated with guilt, shame, indignation, resentment, empathy, compassion, and care ("Chapter 2", 2006). The Ven. Phra Dhammapitaka (Bhikkhu P. A. Payutto) (1995), stated ethics is a good way of life. In this study, ethics is based on 12 principles of scientific ethics, proposed and defended by David B. Resnik (1998) which applies to different aspects of the research process in order to not violate commonly accepted moral standards and to promote the advancement of scientific goals.

Blended learning or hybrid learning is defined as learning that combines online and face-to-face approaches; blended learning enables classroom teachers to increase student learning opportunities beyond the school day and school year (Pape, 2006). An experimental project at the University of British Columbia showed that a mixed-mode university course, combining online learning and face-to-face meetings can encourage students to formulate and express their own ideas more than would be the case in traditional classrooms (Breton, et al., 2005). In addition, a study that has investigated and compared students in face-to-face classes, web-based classes, and hybrid courses which combine both methods showed that hybrid courses have the highest success rate (Brown, 2001).

This study was the second phase of the research study which focuses on implementing the preliminary findings of "Survey of Teachers' and Students' Opinions on Learning Ethics in a Science Classroom" to an actual science classroom. The main purposes of this study were 1) to develop and promote students' awareness and understanding on scientific ethics issues, concepts, and principles. 2) to promote students' thinking skills and communicative skill. 3) to develop and evaluate hybrid learning.

METHODS

The sample group was 24 science students who took a class of fundamental chemistry, 1st semester, 2009 at Mahidol Wittayanusorn School which has the goal of providing world class education at upper secondary levels (Grade 10 – 12) for exceptionally gifted and talented students in science, mathematics and technology so that they will have all the prerequisites necessary to become avid lifelong learners, researchers and innovators. The curriculum also strives to be well balanced and therefore promotes physical fitness as well as humanistic moral and ethical values. Being proud of their Thai identity, the students will be dedicated to national development, and environmental protection while at the same time having a congenial attitude towards others both in Thailand and the world at large ("Mahidol", 2006).
The chemistry course consists of three main chapters which are atomic structure, chemical bonding and periodic table. Ethics in science was incorporated throughout the entire semester. Students were exposed to scientific ethics through the following activities; discussion, ethics quotes, sub-examination, case analysis, oral presentation, experiments, painting and drawing, classroom atmosphere, and so on. This study is a mixed method research. Pre-and-post test, questionnaire and focus group interview were used to obtain data.

RESULTS

From pre-and post-test, it found that after learning ethics in science, students had more understanding in ethical concept and principles than before. There were statistically significant differences in means of the score of pre-and-post test (P=0.05).
According to the focus group interview, for the question "Should this kind of class be the model for other science classes? A student responded to this question that "Yes, it was fruitful, but only our class was be able to get a chance to learn it, not the others. Therefore, it should be offered for use to the other general science classes or it could be in an additional science classes or even in science club". In addition, they thought that all science students should learn scientific ethics because it is very important to get to know the ethical principles and then make use in scientific endeavor. Students agreed that learning ethics in science help enhance analytical, creative and practical thinking skills as well as communicative skill. More importantly, it made them becoming more aware of the need of scientific ethics.

CONCLUSIONS

It was found that students' awareness and understanding were increased as well as thinking and communicative skills. In addition, students were satisfied with use of hybrid learning, even though some improvement is needed. These findings will eventually be offered for use of other schools in Thailand.

ABSTRACT

This paper demonstrates that learning socio-cultural & human values could be taken place through eclectically use of knowledge management principles and role playing, jurisprudential inquiry, participative and personal models of teaching. The principles with the models are supportive and together enhance instructional and nurturing effects on students learning and academic achievement in the first grade high school physics. Findings of this semi-experimental research with two control and experimental groups using pre and post test, SPSS and Java soft-ware demonstrate significant t value regarding academic achievement and socio-cultural & human values. The findings confirm the usefulness of the approach in teaching.

Keywords: *knowledge management principles, teaching & learning models, socio-culture & human values*

INTRODUCTION

How education could be responsive to the trends and challenges of socio-cultural and human values have become a major concern in the contemporary societies. The school reform towards new paradigm is one important worldwide initiative to promote school socio- cultural & human values, knowledge, self- initiative and autonomy for enhancing effectiveness and educational quality.

The Teaching & learning models that are used in the prepared scenario of teaching physics to the first grade high school students encompasses learning processes with the full range of nurturing and instructive effects on students' socio- cultural & human values which should be encountered in school settings. According to what Sallis and Jones (2002) define uses of the principles of knowledge management, the scenario of this research that works as an independent variable is made upon concepts and principles of knowledge in managing individual and group of students learning. The scenario of teaching also makes use of appropriate means and technology, students management in the class, their knowledge, their social interactions in performing tasks, their decision making and the way that information flows in the process of learning. As Davenport and Prusak (2000) state knowledge is a fluid mix of framed experiences, values, contextual information and expert insight that provides a framework for evaluating and incorporating new experiences and information. Not surprisingly, much of literature explores corporate applications of knowledge management including: different conceptions of organizational and personal knowledge; strategies for managing knowledge (Nonaka et al., 2001); and case studies of the impact of knowledge management on organizational success (Kreiner, 2002).

While one would suppose that educational organizations are relatively knowledge-intense organizations, there has been little discussion of knowledge management as a strategy for improving organizational practice, program implementation and teaching and learning within education (Fullan, 2001). At the moment, there is a lack of discussion within education of the potential of scaling-up these opportunities to create more systematic and systemic strategies for codifying and cataloguing knowledge and improving teaching and learning outcomes in schools (Fullan, M. ,2001).

METHODS

This semi-experimental study with two control and experimental groups is a description of teachers' approaches on applying knowledge management principles together with models of teaching for promoting students' socio-culture & human values.

RESULTS

Table 1 shows components of knowledge management in use of teaching and learning and the statistics organized through data acquired from the research questionnaire**.**

Table 1- Teachers' approaches to K.M. model for teaching & learning models

Component	Mean	Df	Std. Error Mean	Std. Deviation	T	Significance level
Creating Knowledge	3/37	83	0/05	0/48	16/61	0/01
Sharing Knowledge	3/21	83	0/07	0/69	9/43	0/01
Organizing Knowledge	3/07	83	0/07	0/69	7/53	0/01
Utilizing Knowledge	3/45	83	0/06	0/63	13/75	0/01
Assessing Knowledge	3/10	83	0/07	0/70	9/86	0/01

Table 2- Group statistics on academic achievement (control & experimental)

Groups	Mean	Std. Deviation	df	T value	Significance level
Control group	2/40	1/11	48	0/11	0/01
Experimental group	2/36	1/28			

CONCLUSION

From table 2 one could conclude that there is a significant mean difference between control and experimental groups which secures the generalization of implementing the approach for teaching other subjects. More statistical evidence on the size effects of this approach on students' socio-cultural and human values needs to be explained in full-paper..

INCREASING ACCESS TO HIGHER EDUCATION: MULTICULTURAL EVALUATION

Irit Sasson

Department of Education in Tel-Hai Academic College,
Upper Galilee, 12210, Israel

iritsa@adm.telhai.ac.il

ABSTRACT

Accessibility Program for Higher-Education is a regional project that aimed at strengthening the potential of high-school students, and increasing the number of students that pursue higher education with emphasis on science domains. This research investigated students' attitudes (N=151) to science, self-efficacy, and exposure-rate to academic world before and after attending the accessibility program. Comparison was done between Jew and Arab students. No significant differences between Jew and Arab students were found in self-efficacy and general attitudes to science in the pre questionnaires. Nevertheless, Arab students declared significant higher interest in chemistry, computer-science and biotechnology in respect to the Jew students.

Keywords: Higher-Education, attitudes, science, self-efficacy

INTRODUCTION

The gaps between the periphery and the center in Israel are growing larger. These gaps are due to economic differences and mostly as a result of opportunities available. As opposed to their peers in the center of the country, many potential students in the periphery do not seek for academic education. Higher education must be offered to everyone and talent must be nurtured. The future of a society is dependent on educational excellence for all. Accessibility to higher education in Israel is particularly low among Arab students, only about 11% of all undergraduate students (Yogev, 2000). Perna (2002) concluded that pre-college programs can have a significant impact on the academic preparation and college enrollment of students from groups that have been under-represented in higher education. The basic requirement for Higher Education institute in Israel is an Israeli matriculation certificate, therefore initial gaps among different ethnic groups initiate during the high-school educational system. Major efforts for increasing access to higher education should be specified to high-school students.

Significant concerns have been raised over the last decade about lack of science interest and poor science achievement among high-school students in Israel. This tendency is stressed among Jew students. Science achievement was linked more closely to science attitudes than to aptitude among junior-high-school students (Houtz, 1995) and to self-efficacy (Martin, 2001). Self-efficacy is students’ belief and confidence in their ability to understand or to do well in their academic work, to meet challenges they face, and to perform to the best of their ability. Nevertheless, the value of academic science enrichment programs for improving science motivation and confidence and therefore increasing the accessibility to higher education is far less clear.

The Accessibility Project for Higher-Education at Tel-Hai Academic College, located at the most north region of the country, is a unique program aimed at strengthening the potential of high-school students, and increasing the number of students that pursue higher education.

The educational goals of the project are: to construct a natural educational continuity between high school and higher-education; to prepare students for higher education, with an emphasis on contexts and educational strategies in science and mathematics; and to expose students to hands-on laboratory work and computerized learning environments that are not available at local schools. Curriculum development is based on the constructivist approach which views learning as an active process that constructs meanings in the learners' minds (Rosenfeld & Rosenfeld, 2006). Special bilingual supplementary assistance is provided to overcome language difficulties among Arab students (partial translation of the learning resources that is reduced gradually during the program and a support by Arab undergraduate students).

METHODS

151 high-school students (65 Jews and 86 Arabs) aged 14-15 participated in the project. The purpose of this research is to investigate students' attitudes to science, self-efficacy, and exposure-rate to academic world before and after attending the accessibility program. All participants received pre and post questionnaires.

RESULTS

Table 1 presents results of analyzing the pre questionnaires.

Table 1: Students' results- Pre-Questionnaire; N=151

n.s= no significant

Category	Jew Students N=65		Arab Students N=86		t Test
	Mean (Max=5, Min=1)	S.D.	Mean (Max=5, Min=1)	S.D.	
General Attitudes to science	3.70	1.07	4.00	1.12	n.s
Self-efficacy	3.83	0.89	4.06	1.07	n.s
Exposure-rate to academic world	2.84	1.20	3.04	1.41	n.s
Interest in chemistry	3.15	1.26	4.31	1.01	$t=2.136; P<0.04$
Interest in physics	2.97	1.08	4.25	1.29	n.s
Interest in computer science	3.46	1.35	4.06	1.06	$t=2.289; p<0.03$
Interest in biotechnology	3.15	1.15	4.13	0.63	$t=2.278; p<0.03$
Interest in Mathematics	3.35	1.34	4.26	1.27	n.s

CONCLUSION

Initial results revealed no significant differences between Jew and Arab students in self-efficacy and general attitudes to science in the pre questionnaires. Nevertheless, Arab students declared significant higher interest in chemistry, computer-science and biotechnology in respect to the Jew students. The research is still under investigation in order to explore the program effects on high-school students.

ABSTRACT

The primary purpose of this study is to describe opinions of pre-service science and mathematics teachers' environmental knowledge, environmental attitude, environmental uses and environmental concern. Secondary purpose of the study is to investigate the correlation between these constructs. This study was conducted with 167 pre-service science and mathematics teachers by using environmental literacy questionnaire. Results of the study revealed that participants have inadequate knowledge about the environmental issues and they generally have a positive attitude towards environmental issues. Also there is a low positive correlation between the constructs i) knowledge and attitude ii) attitude and behavior iii) attitude and concern.

Keywords: *Environmental literacy, pre-service teachers*

INTRODUCTION

Because of the rapid development of the countries, industrialization increase across the world. If the essential importance is not given to the environment, inevitable hazardous conditions will occur. The role of the teachers is important to develop consciousness about the environment and so it is important to educate the pre service teachers about the environment. What they know and how they behave about the environmental issues has become an important issue. In Turkey little research has been done about the issue of pre-service teachers' environmental literacy. (Tuncer et al., 2009)

The purpose of this study is to examine the opinions of the pre service teachers about the components of the environmental literacy; environmental knowledge, attitude, concern and behavior and to reveal the correlation between these constructs. The environmental literacy questionnaire is used in the study and the study was carried out during the fall semester of 2009. Sample of this study constituted 167 pre-service science and mathematics teachers from a public university in Ankara.

METHOD

In this study, the survey data was statistically analyzed using frequency distributions and zero-order correlation. The research was conducted using an environmental literacy questionnaire. The questionnaire is composed of close ended questions and four components such as knowledge (11 items), attitudes (10 items), uses (19 items) and concerns (9 items). The knowledge component of questionnaire is composed of multiple choice items to assess pre-service teachers' knowledge about current environmental issues and it was developed by National Environmental Educational and Training Foundation

(NEEFT) and Roper. The other three components are regarding pre-service teachers' environmental attitudes, uses and concerns using five Likert-type scales. The instrument was originally developed in English and, translated and adapted into Turkish. The internal consistency of the knowledge, attitudes, uses, and concerns dimensions were found to be 0.88, 0.64, 0.80, 0.88, using Cronbach alpha respectively (Tuncer et al., 2009). In our study, the internal consistency of the knowledge, attitudes, uses, and concern components were found to be .44, .43, .70, .72. using Cronbach alpha respectively. This study was carried out during the fall semester of 2009. This study was conducted with 167 pre-service teachers (124 female, 43 male) in secondary science and mathematics department in a public university in Turkey.

RESULTS AND CONCLUSION

The frequency distributions of responses to the survey items were analyzed for pre-service teachers' level of environmental knowledge, attitude, uses and concern. Furthermore, the relationship is examined among the components of environmental literacy questionnaire. In environmental knowledge test, most of the pre-service teachers (91.6%) answered correctly the items related with definition of biodiversity and the industrial discharges are major sources for surface water pollution. The environmental knowledge item with least correct responses (24.6%) were interested in motor vehicles as the largest contributor of carbon monoxide whereas surprisingly more than 73% of the pre-service teachers answered incorrectly stated factories and businesses are the main source of carbon monoxide. The majority (38.3%) of respondents answered 'I don't know' for the knowledge item concerned storage of nuclear waste. NEEFT and Roper (2005) calculated letter grades based on percentage of respondents correct answer determining that cumulative scores of higher than 70% were acceptable levels of environmental knowledge. In our study, 37.2 percent of pre-service teachers received passing grade according to NEEFT and Roper's grading scale (see Table 1). In the attitude scale, most of the respondents (97.7%) agree with the item 'plants and animals have as much right as humans to exist.' On the other hand, a large percent of respondents disagree (71.8%) with the item 'the so-called ecological crisis facing humankind has been greatly exaggerated'. Per-service were also examined in terms of environmental uses and the results showed that most of the pre-service teacher seem aware of individual responsibility, the importance of environmental issues and, the role and the importance of interaction between environment and humans as well as they seem interested with the solutions of the environmental problems. In the concern dimension of the survey, according to the analysis per service teachers aren't very concerned about many environmental issues except poor drinking water quality (65.9%) and indoor air pollution(59.9%). We examined the relationship between pre-service teachers' environmental knowledge, attitudes uses and concerns. The results indicate that respondents' environmental attitudes have small but positive relationship between their perceptions of environmental use. (r= 0.28). The relationship between respondents' knowledge and environmental use small but significant (r=0.25). Similarly, it was found small but significant relationship between respondents' environmental concern and uses (r= 0.27).

Table 1. Pre- service teachers' aggregate scores for environmental knowledge items

Number of questions answered correctly	Score percentage range	Percent of respondents per score	Cumulative percentage of respondents	Adequacy of score
10 or more	90-100 %	7.8	7.8	Adequate
9	80-89%	8.4	16.2	Adequate
8	70-79%	21.0	37.2	Adequate
7	60-69%	16.2	53.4	Inadequate
6 or fewer	59% or less	46.8	100.0	Inadequate

ABSTRACT

Programs for the professional development of teachers are essential mechanisms for sustaining teaching ability throughout a career. This study conducted in depth interviews with 30 science teachers about their experiences in current programs. The results indicated a lack of relevant content in the material that is currently provided, and a program structure which is insufficient to address the needs of individual teachers as they continue to grow professionally. The framework that this study proposes consists of seven stages which allow teachers to continue learning and improving based on their experience level and individual needs.

Keywords: *science teachers, professional development, framework*

INTRODUCTION

Teacher professional development programs are an essential mechanism of quality education because teachers who continually improve and build on their skills are better educators. These programs should inform teachers of innovative and effective teaching practices, but also must challenge each teacher based on their individual needs and career development. Several studies (Desimone, et al., 2002; Penuel, et al., 2007) have examined the effectiveness of these programs based on their overall structure, program content, teacher involvement and participation, and the implementation of acquired skills. Additional studies (Mamlok-Naaman, Hofstein, & Penick, 2007; Yager, 2005) developed alternative approaches for implementing teacher programs that were designed to more clearly represent the reform agenda. However, these studies seem to overlook the importance of addressing the different stages of professional development within the teaching community.

The educational needs of specific teachers must be addressed if professional development programs are to be effective. Their career stage, individual ability, educational level, and professional responsibilities must be taken into consideration. The most effective way to address the varying needs of teachers is through the implementation of a professional development program structure that consists of multiple stages, with content that is relevant to the needs of the teachers within each category.

There are several models that describe the various stages of professional development. For instance, Huberman (1989) defines five career stages consisting of; career entry (1~3 yrs), stabilization (4~6), the divergent period (7~18), the second divergent period (19~30) and disengagement (41~). Some professional development programs for new teachers focus on teacher retention during a period when a high percentage of teachers leave the profession. This is an example of a development program that targets the specific needs of teachers based on their career stage. Other professional development programs have adopted individual school-based mentoring as a strategy for promoting the exchange of skills and knowledge between teachers with different levels of experience. Many countries, including England and Germany (Hobson, et al., 2009; Jones, 2001), have utilized this type of mentoring program and have seen positive results.

Although these types of studies have received much attention internationally, they have gone largely unnoticed within Korea. It is imperative to identify the characteristics of effective professional development programs in order to develop a more functional program. This study identifies fundamental issues and obstacles that are faced by professional development programs for science teachers. Based on this analysis, a framework is proposed that will enable teachers to continue learning throughout all stages of a teaching career.

METHODS

Related literature was reviewed and policy documents were analyzed. In-depth interviews were conducted with 31 intentionally selected science teachers nationwide. An additional data source was a focused discussion between the 16 coordinators of professional development programs at the provincial offices of education and 12 professors of science teacher education.

RESULTS

The study's results indicate that professional development programs for science teachers are not providing relevant content. Additionally, these programs are primarily lecture based, and don't provide opportunities for teachers to reflect on their teaching practices, which makes them passive learners. Summative assessment at the end of each program was given as a written and multiple choice test, where test scores were utilized for teacher promotion. Consequently, real learning and implementation of program content was not effectively measured. Coordinators expressed difficulty in developing professional development programs for the current reform agenda, in developing programs appropriate for different stages of teachers, in locating lecturers that follow program curriculum, and in recruiting teachers to participate. The focused discussion group revealed that there was no system of professional development that addressed the changing needs of science teachers throughout their careers.

CONCLUSIONS

To successfully facilitate creativity through student-centered teaching strategies, math and science teachers must maintain a current knowledge base of scientific and technological progress as well as innovative teaching strategies. Professional development programs must provide relevant content to existing school curriculum in consistency with reform policies and newly developed curriculum. Above all, professional development programs must be designed, assessed, and implemented on the basis of individual teachers' needs at different stages. An effective framework of professional development programs for science teachers will incorporate a long term plan for continuous growth throughout a teaching career. This framework for professional development programs will function as a mechanism for the continual deepening of knowledge and skills necessary for teachers to maintain high educational standards.

A RELATIONSHIP BETWEEN THE UNDERSTANDING OF CREATIVITY AND THE METAPHORS USED IN DESCRIBING TEACHING STYLES

ABSTRACT

Facilitating creativity is a major goal in gifted education, and teachers must have a more comprehensive understanding of creativity in order to implement effective teaching strategies. In 2005, 158 teachers of gifted classes completed an open ended questionnaire asking them to describe their perceptions of creativity and to express their teaching style through the use of metaphors. This study indicated that teachers who have a more balanced understanding of creativity tended to use metaphors such as painters, inventors, architects, and designers. However, teachers with an incomplete understanding of creativity more often described themselves as coaches, commanders, leaders, etc.

Keywords: *science and math teachers in gifted education, metaphor about teaching, creativity.*

INTRODUCTION

In order to encourage the development of gifted students, gifted education emphasizes differentiated curriculum and individualized teaching and learning according to each student's ability and potential (Kaplan, 1991; Van-Tassel Baska, 2003). Therefore, the success of gifted education may depend on the extent to which learner-centered teaching and learning is provided (Hansen & Feldhusen, 1994). The most effective teachers for the gifted can be better selected by evaluating their abilities and skills in implementing learner-centered teaching.

Studies focusing on the characteristics of teachers for the gifted have revealed that more successful teachers tend to employ teaching strategies based on proven theories of gifted education as compared to less successful teachers (Hanninen, 1988; Tomlinson et al., 1994). Furthermore, it has been found that successful teachers posses competencies in teaching critical thinking skills, problem solving skills, and creativity (Chan, 2001; Starko & Schack, 1989; Story, 1985). Due to the fact that facilitating creativity is one of the primary goals in gifted education, teachers must be competent in the use of differentiated teaching strategies for developing creativity.

Although various components of creativity were recognized and introduced by many researchers, Urban's components were the most widely accepted in Korea's gifted education program. Urban (1995) suggested three main components in the development of creativity, which related to cognitive, personality, and environmental factors. Cognitive aspects of creativity included divergent thinking, general knowledge, and domain specific knowledge and skills. Personality related factors included task commitment, motivation, openness, and tolerance of ambiguity. Individual, local, and global environmental components were also suggested to be important. According to Urban (1995), these three components interact to facilitate creativity. This view is favored in gifted education in Korea because it helps teachers to recognize multiple dimensions of creativity. Consequently, teachers are expected to have an understanding of all three components of creativity.

Previous research revealed that teachers' views of creativity differed from the traditional views (Dawson et al., 1999), and there was an indication that there might be cultural differences as well (Chan & Chan, 1999). Thus, to facilitate creativity in gifted education in Korea, it seemed necessary to study Korean teachers' understanding and perceptions of creativity. Additionally, an assumption can be made that teachers in gifted education who have a more complete understanding of creativity will be better prepared to implement more effective teaching approaches.

In this study, we first examined teachers' understanding of creativity using Urban's cognitive, personal, and environmental components. Second, we evaluated teachers' perceptions about their own teaching style by evaluating their use of metaphors in expression. Finally, we analyzed how each teacher's understanding of creativity related to their choice of metaphor in describing their teaching style.

METHODS

Data were collected using opened-ended questionnaires from a total of 158 teachers including 40 science and 23 math teachers at elementary schools and 67 science and 28 math teachers at the middle school level in August 2005. This questionnaire was administered during participation in an in-service training program for gifted education. Teachers were asked to define creativity and to choose a job as a metaphor for their teaching style. The relationship between teachers' understandings of creativity and their use of metaphors was then analyzed.

RESULTS

It was found that most teachers mentioned the cognitive aspects of creativity, which indicates an incomplete understanding of creativity as a whole. Only a few teachers had a well-balanced view that mentioned the three components. Science teachers' understanding of creativity appeared to be more comprehensive than mathematics teachers, who rarely mentioned any aspect of creativity but the cognitive. Teachers whose understanding of creativity skewed toward the cognitive component often described themselves as a sports coach, ship captain, team leader, etc. Teachers who mentioned the cognitive aspects as well as environmental conditions were more likely to describe their teaching with metaphors of painters, inventors, and designers. These teachers are considered to utilize student-centered approaches more often.

CONCLUSIONS

To successfully facilitate creativity through student-centered teaching strategies, math and science teachers must have a well-balanced view of creativity. Therefore, teacher training programs should incorporate education about multiple dimensions of creativity. Additional studies might further investigate the correlations between individual teacher characteristics and their teaching styles and understanding of creativity.

ABSTRACT

The main purpose of this research explored the conceptions of shadows of 16 Paiwan children, who are aboriginals in Pingtung County (southern of Taiwan), from ages 4 to 5 selected from four kindergartens. The concept of shadows was explored from different ways such as shape, size, orientation, tint and awareness of shadows, and the relationship between light sources and shadows. The children were interviewed to answers questions about shadows by choosing the right pictured card, and gave reasons after the choosing. The qualitative and quantitative data were collected. Results showed that children with age 5 understood the concept of shadows in some degrees better than those with age 4 except the awareness of the shadow in daytime, the explanation of the direction of shadow, and the influence of light intensity and object transparency.

Keywords: *aboriginal children, shadow, conceptual development*

INTRODUCTION.

Few studies have been done about the conceptions of shadows of children below ages 6. Segal and Cosgrove's (1993) study is the only one who investigated children below ages 6 about their ideas of shadows. They found that most of five-year-olds thought of shadows as a part of the object and light as for shadows to push out or to be seen. How do four- and five-year-olds think about the orientation, tint, size, and shape of shadows? The purpose of the study was to investigate the ideas of Paiwan (aboriginals in southern Taiwan) children below ages 6 about the orientation, tint, size, and shape of shadows.

METHODS.

Seven four-year-olds and nine five-year-olds (3 boys and 6 girls) were selected randomly from 2 private and 2 public kindergartens in Paiwan aboriginal areas in Pingtung for the study. No shadow related curriculum has been implemented in these kindergartens during the interview period. The major task included 10-item questions with answers on two separate color pictured cards, which contained a correct and a wrong situation of shadows. The task was modified from Osborne and Gilbert's (1980) interview techniques. The children were interviewed individually in a semi-structured protocol, which included asking questions and answering them by choosing a correct card and then explained why they chose them.

The interviews were both audio-taped and video-taped. All the audiotapes and videotapes were transcribed. Children's performance on the task was rated by two raters, and the inter-rater agreement in the study was 94. Mann-Whiteney U was used to compare the performance in Paiwan 4 and 5 years old children.

RESULTS.

Most of the correct responses about shadows of Paiwan five-year-olds and four-year-olds were close. For example, five-year-olds made significantly more correct choices than four-year-olds on the item about the tint of shadows in the pictured task (Mann-Whitney $U= 24$, $P< .05$) (Marascuilo & McSweeney, 1977). Their level of the justifications was significantly higher than that of four-year-olds. Five-year-olds correctly chose the shadows of transparent object than four-year-olds. But four-year-olds made more correct choices than five-year-olds on the item of shadow orientation (Mann-Whitney $U= 7.5$, $P> .05$).

CONCLUSIONS

The conceptions of shadows of Paiwan five-year-olds and four-year-olds are quite similar. Five-year-olds cognized significantly better on the shadow tint than four-year-olds, and four-year-olds better only in shadow orientation. The results give us some important data that there was not much difference between Paiwan 4 & 5 years old children about shadows. They knew the shape and size of shadows, but cognized hazily in the tint and orientation. The result was quite different from that of our previous research in 2007 (Chen & Chang, 2007). It can be investigated in the future research.

ABSTRACT

In the present work, we examine the relationship between teacher’s and students' classroom activities. We investigated the activity of a group of students solving a Physics problem involving the concepts of "work" and "energy." During problem solving process, the observation of the teacher's interventions was essential to understand the changes occurred in the students' activity. The interaction between the teacher and students reorganize and redirect the activity, causing them to negotiate the objectives and available tools within the activity. A critical look at the teacher’s actions gives us insight into the learning process beyond group development in the solution of a Physics problem. To structure this analysis we used Activity Theory, as well as two principles that are seen as a foundation: mediated action and dialectical relation between the development of human psyche and the development of human activity.

Keywords: *Activity Theory, groups, dialogical interaction, problem resolution.*

INTRODUCTION

In this paper we analyze a case study involving a group of students solving a Physics problem under their teacher’s orientation. We investigated the interactive processes that occurred in the group during a specific task. We aim particularly at understanding the teacher's intervention in the group and the consequences of this intervention to the group dynamic. We use some categories of Activity Theory from a socio-cultural-historical perspective. Generally, investigations of groups go through two theoretical and methodological ways of analyzing products and processes: the “product analysis” usually highlights the end of the tasks, i.e., the outcomes produced by the group; on the other hand, the “process analysis” addresses the dynamic development of the group. In this work we looked at processes believing that this microgenesis study can give complex information about the relationship among students and the completion of the specific task: the resolution of a Physics problem. For instance, Hake (1998) suggests that interactive engagement lead to better results than single lectures when one works with students organized in groups. We also point out to Heller’s work (1999) and the creation of a structure of Physics problems to be solved specifically by groups of students.

On the other hand, we believe working in groups does not guarantee the success of a task solution in itself. A lot of other elements should be considered when studying group dynamics. For instance, the teacher's intervention in group activities reorganizes the task, changing the dynamic of the group interaction and learning.

FRAMEWORK

Activity Theory emerged from Vigotski's works and was subsequently developed by Leontiev (1978). This theoretical framework is based on two principles: the first one is mediated action, in which the relationships between humans and the world are necessarily mediated by a tool. Another one is the close relationship between the development of activities and the development of the human psyche, which makes the activity a privileged element for understanding the psyche.

Attempting to better understand human activity, Engeström (1987) points out to implicit elements in Leontiev's version of the activity theory stresses the idea that activities should be considered as units of analysis, considering that they consist of the smallest and simplest unit that still preserves the essential unity and integral quality behind any human activity (ibid, p. 100). The author inserted three other implicit elements in the basis of human activity: community, social division of labor, and rules.

From this point of view, human activity is organized on triadic relationships: subject–object mediated by tools; subject–community mediated by rules; community–object mediated by social division of labor. Engeström highlighted the organization of activities, allowing us to understand the production, distribution, and exchange (or communication) within human activities. In our specific case study, Engestrom's contribution enables us to understand the interaction among activities, i.e., students' activities and teacher's activities.

METHODOLOGY

Data were collected from a first-year class of high school students at a Brazilian private school. Students ages ranged from 14 to 16 years old. We used the technique of participant observation, where the researcher remains in the research environment during classes, sometimes collaborating with the teacher and making field notes. Video records were also used to provide further details of the group dynamics.

CASE STUDY

We analyzed one group among 7 others. The task students had to solve was an exercise where they needed to use the Physics concepts of work and energy. The problem consisted of an elevator carrying some people from the fifth to the ninth floor. The goal was to calculate the work of the weight and energy spent in the process. To do that students had to estimate the resultant and calculate the total weight loaded by the elevator.

The teacher asked each student to perform different functions to solve the task, allowing the participation of all members during the fulfillment of the task. Students played the roles of *leader*, responsible for carrying out the task; *recorder/checker*, in charge of writing the resolution of the exercise; and *skeptic*, responsible to ensure that other members understand the solution (Heller, 1999).

Our focus was on the teacher's interventions during the task. The main reason to look at this situation lies on the fact that the teacher reorganized the actions of the groups each time he interfered, stimulating the activity.

We observed that every intervention by the teacher promoted significant changes in the group activity. These changes occurred in different spheres of mediation during the activity. The first intervention was the initial distribution of the students' roles in the group (*leader*, *recorder/checker*, and *skeptic*), determining modes of interaction among students through a social division of labor. During the class, the teacher intervened indirectly by redistributing roles, thus reorganizing the social division of labor. The rearrangement of the interaction rules among students reflected directly upon and changed the way the groups solved the problem.

All the times the teacher provided new mediation tools—such as new concepts—the activity was reordered by the change in its goals. There were two modes of interaction allowing for this change, when the teacher re-signified some meanings of the context of the questions, which demanded the renegotiation of the goals previously understood by the students. They changed their focus and traded some subjects by others during their task. The second mode occurred when the teacher taught, i.e., when he provided a specific content explanation (by giving a definition, for instance) that explained the concept of work. In each case the teacher provided new tools, enabling students to move on in terms of solving the problem.

DISCUSSION AND CONCLUSIONS

Looking at the teacher's interventions in the groups of students, we could see that the teaching activity is coordinated with the activity of students. Understanding that teachers and students are engaged in a "school activity" for different reasons allows us to realize that the teacher's interventions are not always productive in terms of problem solving tasks. In fact, the teacher is not directly interested in the solution of the problem, but on the acquisition of certain concepts. It is this wider context that allows us to understand the teacher's interventions as an inquiring action instead of a simply informational action where he gives specific content explanations.

Finally, group development processes help us to understand the learning experience in a broader sense. Beyond the product of the solving problem activity—problem solution—students are dealing with a higher layer of the learning process—*learning as an activity of transformation*—which means they are learning how to negotiate meanings, to scheme and scan their textbooks, asking for help from their most capable peers for answers, and developing other problem solving skills. The dialogical interaction is an important skill to be developed by Science teachers as one of the main ways to teach scientific collaboration and inquiring.

INNOVATIVE PRACTICES IN SCIENCE EDUCATION - ARE THEY TRANSFERRABLE?

Špela Stres

Jožef Stefan Institute

spela.stres@ijs.si

ABSTRACT

We have chosen 5 different innovative practices of connecting science to educational system, including the one of Jožef Stefan Institute, which will be presented in the format chosen to give information and features we think are important to communicate to another country.

This abstract will be used in the symposium program to describe your presentation. The abstract should be fully justified.

Keywords: *science education, transferability, EU, innovative*

INTRODUCTION

What information should we collect in order to describe the innovative practices well enough to be understood and chosen by another country in order to make science education more comparable through different countries? How do we distinguish a good innovative practice from an average one? What information do we have to receive in order to be able to choose a practice and adopt it in our own country?

We have chosen 5 different innovative practices of connecting science to educational system, including the one of Jožef Stefan Institute, which will be presented in the format chosen to give information and features we think are important to communicate to another country, as e.g. Subject/ Time needed/ Methodology/ Age level; What percentage of teachers at the school/subject level participate in the innovative practice?; How relevant is the support from the school headmaster and management in general?; What is the connection to the curricula (from the stage where it is already included - no major changes necessary up to proposals that are completely out of the curriculum - time and content-vise); Are the teachers already qualified to participate in this innovative practice? Do they need extra tutoring or education to participate in the innovative educational practice?; Where are the reasons that the activity under a particular innovative practice is not higher?

THE CURRENT STATUS OF SCIENCE EDUCATION IN EUROPE

Acknowledging that a meaningful comparative study between different innovative practices (IPs) can only be made on a basis of numerical indicators, such indicators will be presented together with the five cases, as an example of how the indicators can be used. Some of the indicators we suggest will be presented to answer questions like - What are the the main difficulties in science education and how to overcome them.

In a broader sense this work is connected to the FP7 project kidsINNscience, where 8 European and 2 Latin American partners are thinking about how to the form a general information on what is important for contextualizing the innovations, the state of science education and of science education innovation in our countries - in particular to enable innovative practices to be transferred among countries. The project itself has just started in November 2009, so results of this presentation are preliminary and are in this contribution focused on one country - Slovenia.

METHODS: national context based proposal on indicators

To establish a possibility of comparison in innovative practices of different countries, a necessity of measurable indicators has been observed. The indicators were proposed in the first phase for the evaluation of the learning environment as one of the most important parts of the learning process.

RESULTS: THE INNOVATIVE PRACTICE CASE TO BE EVALUATED FOR TRANSFERRAL

Often children in kindergarten are left out of the science education system.

This elimination leads from the starting point inevitably to the low interest in science and technology that we observe in general today.

The described innovation is part of the compulsory curriculum, since all children of this age need to be faced with certain scientific concepts. The expansion of this practice is its inter-disciplinary and the fact that it does not deal with disconnected problems, but rather with a story, connecting all the issues in question.

It represents one of the "best practice examples" in Slovenia. Even though the Curricula enables and supports such approach, there is a small number of of such advanced approaches in Slovenia.

Main focus of the innovative practice: science contexts, scientific competencies, knowledge of science and/or knowledge about science, attitudes toward science, following PISA 2006 categories /reference/ . The approaches used in the kindergarten - the context:

5. setting and testing the hypothesis, - scientific competencies, knowledge of science and/or knowledge about science
6. learning process based on sources finding - scientific competencies, knowledge of science and/or knowledge about science
7. "hands on" experimental approach - scientific competencies, knowledge of science and/or knowledge about science, attitudes toward science,
8. simulation of different "real life" situations - scientific competencies, knowledge of science and/or knowledge about science, attitudes toward science,
9. creative approach - scientific competencies, attitudes toward science

CONCLUSIONS: NEW INDICATORS PROPOSED WITHIN CONSCIENCE PROJECT

however, the usage of the originally proposed indicators established to be impossible with the purpose of evaluation of a particular innovative practice case. Thanks to the Brazilian team of Rio de Janeiro, a new indicator system has been introduced, as can be seen below in **Figure 1.**

Evaluation of general status of the status in the particular age group and subject group was carried out to find out that the result is only 54 out of 100 points. This is not a surprising result, since the general field status is not comparable in quality and potential to the presented innovation case already on a subjective level.

However, we were looking for ways to prove this and with the indicators the possibility arose.

ACKNOWLEDGEMENTS

This work is supported by the Ministry of science, higher education and technology of Slovenia. We would like to thank the useful discussions held at kidsINNscience FP7 project, especially to the coordinators Nadia Prauhart and Markus Meissner of Austrian institute of Ecology.

ABSTRACT

The teachers' practice shows that the conceptual understanding of buoyancy among primary school pupils is often deficient. Therefore we have made a design experiment, which includes a unit about floating and sinking. The aims of the unit are: evoke intuitive notions and use it as a starting point on which we build (develop) physical concepts and gradually expand students' understanding of density and buoyancy. The unit was tested among eight grade pupils in two primary schools. In the contribution the results and responses on active learning approach will be presented.

Keywords: *density, buoyancy, conceptual understanding, survey*

INTRODUCTION

An everyday life offers pupils many situations connected to terms of density and buoyancy. Objects float or sink in the liquids and the intuitive notions of pupils in the eighth grade (age 14) are mostly developed in a way that they are able to predict which of the objects will sink or float. The connection of intuitive notions with the theory and conceptual knowledge is often the most demanding part of learning.

Many surveys confirm that the concept of buoyancy is difficult to understand and deserves a precise explanation and well prepared classes (Loverude et al., 2003; Heron et al., 2003; She, 2005).

A proper teaching strategy is therefore needed. In this contribution we present the teaching unit that includes constructivistic aspects and combines pupils' intuitive notions with theoretical concepts.

METHODS

The teaching unit has four steps arranged in a way that each step coincides with one school hour of 45 minutes. It is based on discussions and active learning. Both teaching strategies in corroboration of statement writing in the notebooks stimulate the scientifically correct way of expression and help pupils to overcome intuitive notions and lead them to understanding of concept (Čepič, 2006; Razpet, 2006).

The teaching strategy that is proposed was realized as a preliminary study in year 2008 (29 pupils of age 13). The design researches lead us to improve some weak parts.

Teaching in the class was repeated in December 2009 in two classes (46 pupils of age 13). A parallel study was performed in classes where standard teaching process was taking place. A comparison of pre-knowledge in both groups of pupils will be presented as well as the results of the post test. The research questions were connected to pupils' improvement in knowledge and conceptual understanding of density and buoyancy as well as on the comparison between the test and control group. The research is also aimed to test the efficiency and adequacy of teaching unit for teaching the difficult concepts. Both groups of pupils had the same pre and the post test.

The pre and post test included a few general questions about the age, sex and interests of pupils. The pre test and post tests have questions connected strictly with one of the concepts (density, buoyancy) and questions that combine both.

After the lessons a few pupils were interviewed and recorded. Data collection included pre and post tests of all pupils, interviews of 3 pupils from each class and by classroom observations (field notes). Three observers were helping at experiments and detected the comments and discussions in the class. During the lessons the notes about the atmosphere and pupils activities were performed. Analysis of the data was mostly qualitative (analysis of interviews, field notes from observers during the classes). Quantitative part was focused on some questions from pre and post test, while the other questions were open, which deserved qualitative analysis.

RESULTS

The results indicate that the hypothesis about active learning and assimilated concepts was correct. Pupils describe the teaching unit as attractive and motivative. The memory about the experiments and their explanations did not reduce significantly in three month period. It was surprising that some details were still reproduced in precise way. The research proved problems in the jump from common to scientific language. The Slovene language in a daily talk uses some misleading expressions from the physics points of view. The intuitive notions and expressions from a daily life are coinciding. Through the process of learning the descriptions of the concepts should improve from common language to scientific language.

CONCLUSIONS

Based on the findings of this study it can be concluded, that the concept development of the phenomenon buoyancy can take place by means of a proposed unit. The students develop the meaning of the concept using their intuitive notions and discussion.

ABSTRACT

As a result of the education system restructuring in 1999, new subject – science – has appeared in primary schools. Students of the faculty of Chemistry of the Jagiellonian University, have the opportunity to gain qualification to teach this subject. Students are obliged to participant in different forms of didactic activities – lectures and seminars. It seemed advisable that after a few years experiences check which forms of didactic activities seems to be the most useful for students as future teachers. Particular emphasis was placed on classes related to introduction of the environmental protection issue in the school. The preliminary results of our research will be presented on poster.

Keywords: *science education, environmental education, didactic materials.*

INTRODUCTION

The Jagiellonian University Faculty of Chemistry students may choose to participate in the “Methodology of Teaching Science” course [1, 2]. The course participants are required to complete courses in which special emphasis is situated on topics that are not covered by the program of study, like biology and geography. The course consists of three parts: “Basic of biology” (lecture - 30 h), “Basic of geography” (lecture – 30 h) and “Science didactic” (seminar – 45 h). The main aim of our research was seminar – “Science didactic”. During the seminars, students are obliged, among others, to observe Science lessons at a primary school, to prepare a school trip plan, a Science lesson plan, and a mini-session plan connected with the problems of environmental protection as well as a final Science test for primary school graduates. In order to facilitate future science teachers familiarize themselves with the general aims of science teaching, which are composed of, inter alia, the practical use of science knowledge, curiosity and respect the world of nature. During the excercise students working in groups prepare and then carry out in a form of workshop "Mini- Scientific Session". The topics of this mini-session vary on each academic year, but there are always topics connected with environmental protection [3,4].

This year, three groups of students prepare project on topic 3 R, that is: Reduce, Reuse, Recycle. The task of each group is to discuss the issue in an attractive way and to encourage students to realize in daily life the slogan [5]: Reduce, Reuse, Recycle

METHODS

In order to better know opinions of any group of individuals a survey was applied (data collection type) as one of the research process steps. Survey is one of sociological techniques for collection of data obtained directly by posing questions to selected people who fill in special questionnaires.

The usefulness of conducting “Science didactic” classes was checked with the use of the questionnaire, which contain 7 open questions requiring in-depth reflection on the subject, and sometimes impulsive answer based on first association and 2 semi-open questions where one suggested answer could be selected and justified. This questionnaire was carried out among students. The purposefulness of conducting classes with environmental education was checked by the second questionnaire. Among the respondents there were:

- primary school pupils, to whom these classes are addressed,
- grammar school students, who have recently finished the primary school,
- high school students, who should be familiar with these issues,
- students who will teach these issues in the future

RESULTS

The preliminary results of the first questionnaire were presented in following tables:

Table.1. Assessment of he usefulness of various forms of work

Forms of work	Students' answers
1. Preparing of the scenerio of the lesson	94,5% absolutely yes or yes
2. Presentation of the scenerio of the lesson	77,7% absolutely yes or yes
3. Preparing of didactic materials	83,3% absolutely yes or yes
4. Preparing of a school travel plan	77,7% absolutely yes or yes
5. Presentation of a school travel plan	61,1% absolutely yes or yes
6. Science laboratory	83,3% absolutely yes or yes
7. Meeting in museum	only 38,8% absolutely yes or yes but 33,3% don't know and 27,8% absolutely no or no
8. Observing of school lessons	83,3% absolutely yes or yes
9. Mini- Scientific Session	55,5% absolutely yes or yes

Table.2. Influence of the participation in the Mini Sesion on the develop of certain skills

Skills	Students' answers
1. the group work competences development	77,7% yes or rather yes
2. the discussion competences development	77,7% yes or rather yes
3. ecological knowledge advances	94,4% yes or rather yes
4. active methods knowing	only 55,5% yes or rather yes

The questions of the second questionnaire were grouped into four categories, testing:

1) understanding of ecological terms and the attempt of their application in daily life
2) suitable pro-ecological application
3) acquaintance of action principle
4) students' opinions about pro-ecological actions

Results indicate that pupils are familiar with environmental issues but not always they knew how to used this information in everyday life.

CONCLUSIONS

The results obtained confirm the desirability of conducting didactic activities to enable students to acquire skills to teach about environmental issues. At the same time shown that forms of didactic activities during the course of "Science Didactic" were chosen properly

ABSTRACT

The basic question in modern times is how to educate students to perform appropriately in situations that were unknown during their educational period. The European Parliament has published a framework of key competences for lifelong learning. For science teachers, this means that they need not only to possess these competences but also to prepare teaching activities in such a way to enhance development of these competences in their students. In the case of digital competence, this mean that science teachers must be able to use a much broader array of applications and handle equipment which is not used by teachers of other subjects.

Keywords: *Computers, Digital competence, ICT, Science teachers, Teacher education*

INTRODUCTION

If we recognize the demand for flexible and better educated digitally competent citizens as one of the main goals of educational systems (Bawden 2001; Illeris, 2008, p. 2), then teachers have to be one step beyond their students. Teachers should not only possess the appropriate knowledge, skills and attitudes towards the proposed competences but must also be additionally competent in pedagogy for their successful classroom implementation in order to enhance learning. As a suitable theoretical framework towards the development of teachers' competences, we can use the model of Technological Pedagogical Content Knowledge (Mishra and Koehler, 2006).

METHODS

Article is based on authors' first-hand experiences in introduction of computers in biology teaching at secondary general and higher vocational schools and trainings of in-service and pre-service biology teachers.

DIGITAL COMPETENCE IN SCIENCE TEACHING

One of the basic competences is digital competence, which *"involves the confident and critical use of information society technology (IST) and thus basic skills in information and communication technology (ICT)"*. In the case of teachers, we can recognize the double role of ICT in their lives. The first role is to fulfil their personal needs as digital citizens with their skills in and knowledge of computers in their role of clerical, informational and multimedia tools. On the professional level, their role does not end with the use of ICT to improve their teaching content, to support school administration and to function as a desk-top library; in addition they have to cooperate with other educators in an effort to educate digitally competent students.

As science educators, we can easily recognize that general definitions and frameworks concerning digital competence (digital literacy, ICT-competence, etc.) in school work are too narrow because science teaching, especially in practical, laboratory and field work, goes beyond common teaching practices used in most other subjects. On the other hand, demand for the use of digital technology in school laboratories, field-work, or the classroom creates additional responsibility for science teachers. Students can use computers as sophisticated typewriters, as desktop libraries, or communication tools, and for multimedia in literally every subject, while the use of ICT units as processors, controllers, and data-loggers can be introduced in only a limited set of school subjects or activities. In this case, if, for example, one teacher at a school does not promote the use of computers in the classroom as a tool for finding information, the loss for students is minor, because with equivalent work in other subjects they can fill the gap. If, on the other hand, science teachers do not use data-loggers in the school laboratory, there is nobody at school to cover the missing knowledge.

LEVELS OF DIGITAL COMPETENCE IN SCIENCE

As a framework for setting competence levels for digital competence in Science we have used and modified levels from Bloom's revised Taxonomy (Krathwohl, 2002). First, we can recognize three levels of digital competence. At the first level are competences defined in the Framework as digital key competence, which should be common to all citizens. At the second level are general professional competences that are common to all teachers, but not to other professions. At the third level are the special-professional digital competences of Science teachers. Such a competence is, for example, the use of data-loggers in the school laboratory. The second divide lies at the level of mastery of digital applications and competence to soundly use them in a classroom. We cannot recognize expertise simply by counting the applications that are used by a teacher. We believe that reaching an expert level in digital competence in Science teaching is a difficult task because of the need for mastery of a wider list of digital equipment and software than in most other subjects.

TEACHER EDUCATION FOR DIGITAL COMPETENCE

Science teachers' education for the integration and full exploitation of available digital technology cannot stop at the level of courses where they are taught only how to use equipment or software, but must include pedagogy and the provision of context where and when such technology can be used. According to Guzman and Nussbaum (2009), teacher education should consist of several domains: instrumental / technological, pedagogical / curricular, didactic / methodological, evaluative / investigative, communicational / relational, and personal / attitudinal. One problematic challenge for many universities that offer teacher education is that existing courses concerning ICT and multimedia are headed by ICT experts, who are rarely experts in, for example, Biology and Didactics. As a result, connections between domains must be made by students, a task which can be demanding at least at the pre-service level. On the other hand, experienced teachers have already built their personal pedagogical content knowledge which, if successful, cannot be easily changed.

CONCLUSIONS

We can conclude that we cannot frame digital competence for science teaching in line with similar training for other teachers. Science teachers can at least potentially use applications and equipment not used by teachers of other subjects, which gives them a heavier responsibility in achieving such competence. Simply sending them to a course or including such a course in pre-service training will fail if they do not find support when they are back in school or when they start teaching.

ABSTRACT

The purpose of this article is to compare the effects of two different teaching methods on students' academic achievement, attitudes, and socio-cultural and humane values. We chose: "Partners in Learning" and "traditional" teaching methods. Semi-experimental research approach was used for a class composed of 18 undergraduate students and the result was compared with the control group with the same size. The result of T-test indicates the meaningful increase of main scores of students in the experimental class of Industrial Electronic laboratory. Therefore, this model could be used for developing socio-cultural and human values and enhancing students' creativity.

Keywords: *Models of teaching; partners in learning; group investigation; effective education; human values; cultural values.*

INTRODUCTION

The concepts of teaching science have been confronted with drastic changes in the contemporary world of education. According to Hyte's "Art of teaching", writing an article about the art of teaching is a difficult job, because the subject is continuously changing. The model of "Partners in Learning" needs professional and skillful teachers who will be able to apply it in the classrooms successfully. Johnson (1974, 1981, 1990) and Sharan (1990) and many others are the supporters of this method which is in contrast with individual competitive method. In this method the learners learn in small groups with mutual cooperation.
Effective training requires a particular method; it is not practicable through restricted, old teaching methodologies. Our main concern is to determine tasks and activities which can be used to improve educational quality as well as planning considering socio-cultural and human values.

METHODOS

In this research we are trying to show the differences between "Partners in learning" and "traditional" teaching methods. Two classes each containing 18 students were chosen on the same course using Semi-experimental approach and the Independent T-Test for both experimental and control groups. For eight weeks one class was trained based on the "traditional method" and the other on "partners in learning", on the same subjects. At the end of the course a questionnaire made by the researcher was distributed among the students. The questionnaire includes 40 items with 5 rate Likert scale which determines its validity and reliability. The items were categorized into 4 components of individual, behavioral, social and cognitive effects on students' socio-cultural and human values. Scores and grades of the classes were compared and measured and are shown in Tables 1 and 2. These tables imply that the model of "Partners in Learning" will increase and develop students learning more than the "traditional" method. The T-Test and SPSS software have been used to analyze statistical data.

RESULTS

In this research, inferential statistics has been applied to analyze the data. It should be noted that it's a two-tail test since the directions are not distinct, that is (H_0= μ1=μ2) and two samples are equal (n=n). As a result the assumption of the equivalence of variances is generally proved. The independent T-Test has been used to analyze data that is presented in detail in the following tables.

Table 1. Independent T-Test between survey questionnaires of students

Indexes / Groups	Average difference	Standard deviation from average	T measure	(df) degree of freedom	Sig. level
Traditional & partners in learning method	59/05	9/19	6/42	34	0/000

The t score is estimated as (t=6/42) with the degree of freedom of df: 34, which was chosen from the Table at the probability level of 0/05 with the crisis level of (t=2/05), as a result the null hypothesis is rejected and the research hypothesis conveying that students' learning and development are increased by the "Partners in Learning" method is supported.

Table 2. The independent T-Test between students' mean scores

Indexes / Groups	Mean Difference	Standard deviation	Standard deviation from average	T Measure	df	Sig. level
The partners in learning & Traditional method	2/61	2/77	2/61	3/16	26/13	0/004

Regarding the absolute value of calculated t (t=3/16) and the degree of freedom (df: 26/13) at the probability level of 0/05, that is more than the t on the table (at crisis level t: 2/056), the null hypothesis is rejected and the research hypothesis is supported that students' learning and development are increased by the "Partners in Learning" method.

CONCLUSION

Because the quality of all the professions and jobs result from educational system, therefore selecting proper method for teaching and learning has a vital importance. Implementing the model of "Partners in Learning" could have a significant impact on socio-cultural and humane values as well as students' academic achievement. The students are not only actively participating in learning, but they can also experience their success in learning. Recognizing its significant success in learning it is recommended that further researches in other selected teaching methods be done in order to be able to generalize the findings.

ABSTRACT

A 44-item survey instrument was designed to determine secondary students' views about how useful various specific actions might be related to reducing global warming, their willingness to undertake the various actions, and the extent to which these two might be linked. The instrument was administered to students in years 7 to 10 (n= 768) from four large English medium schools in Delhi, India. The findings indicated that this cohort of Indian students exhibited very high levels of concern about climate change and strong willingness to act against global warming. The findings are compared with those from two similar survey studies conducted in Western contexts.

Keywords: *Global warming; India; attitude, behaviour, environmental education.*

INTRODUCTION

There is considerable evidence that simply imparting environmental knowledge does not in itself necessarily influence attitudes and behaviours and as such is insufficient to bring about positive environmental impacts (see e.g. Jensen, 2002), as environmental knowledge and pro-environmental behaviour are not particularly strongly linked (Hungerford & Volk, 1990). Rajecki (1982) has argued that there is what has been termed as a 'gap' between knowledge and action. Clearly, as efforts to reduce the contributing factors to global warming must inevitably involve individuals in taking positive environmental actions, it is important to explore the nature of this 'gap' and ways in which it might be bridged or circumvented. However, it has become clear as workers have attempted to generate models of the drivers of environmentally sympathetic behaviour that there are limitations in studying links between environmental attitudes in general and potential behaviour patterns (e.g. Stern, 1992).

To circumvent this issue Boyes, Skamp and Stanisstreet (2009) developed a survey instrument that questions respondents about their specific environmental behaviours and the possible effects of these particular actions on the amelioration one environmental problem - global warming. To date this instrument has been administered to secondary students in Australia and Spain. The study reported in this paper was undertaken using the same survey instrument with 12-16 year old students in Delhi, India, and the study addresses three research questions:

1. To what degree do students intend to undertake a variety of specific ‘environmentally friendly’ actions have been studied?
2. To what extent do students believe these particular actions would be effective in reducing global warming have been investigated?
3. What is the relationship between students’ willingness to undertake specific actions and their beliefs about the usefulness of the same actions has been explored?

METHODS

The survey was administered to 768 secondary students (aged 12-16) from four large English medium schools in metropolitan Delhi. The sample comprised 448 males and 320 females across 5 grades. The schools drew largely from middle and upper middle class families. Following their completion, the surveys were numbered, and the responses were scored and entered onto an Excel data file for analysis. Differences between the distributions of responses between students in different year groups, and between male and female students, were explored using Chi squared analysis.

CONCLUSIONS

In general Indian students exhibited a much greater willingness to take action against global warming than students of a similar age in Australia or Spain. There is always a risk in commenting too definitively on individuals’ intentions or willingness to act, as these intentions may never translate into actual behaviour. Having said this it was interesting to note that in general India students indicated quite a strong willingness to act against global warming and consequently in favour of the environment. There may be a number of reasons for this. At all of the India secondary schools where the survey was administered, environmental education (particularly non-formal EE) was clearly afforded a high profile with support for Eco-clubs, environmental displays and environmentally orientated assemblies. The survey was administered around the time of Earth Day, and this event was being taken very seriously in all of the schools, with teachers and students clearly engaged in raising environmental issues often related to global warming at school assemblies. Furthermore, most commentary about environmental issues in developing countries such as India is linked to social justice with authors such as Kothari and Parajuli (1993) viewing the achievement of social justice as a prerequisite to ecological sustainability. The argument being that the poor of the world are simply struggling to survive and as such do not have the option of the ‘privilege of concern’, something these authors argue is the preserve of the wealthy ‘middle class’. The latter group they argue have the financial ability to look beyond their own livelihood and explore global issues. However, in this particular study the issue of social justice preceding favourable environmental action may not have been applicable given the nature of the sample that drew largely from middle class Delhi. As such this group unlike the majority of Indians probably did have the ‘luxury or privilege’ of concern and could therefore explore global issues, thus perhaps explaining there apparent willingness to act against global warming. However, as some of these students may go on to be future leaders in private enterprise and the public sector, it is an encouraging sign that they do appear to be willing to take action for the environment.

PRIMARY SCHOOL CHILDREN'S DIRECT EXPERIENCE OF AND ATTITUDE TOWARD TOADS

Iztok Tomažič

University of Ljubljana, Biotechnical Faculty, Department of Biology,
Večna pot 111, 1000 Ljubljana;

E: iztok.tomazic@bf.uni-lj.si

ABSTRACT

One of the main goals of Slovenian biology and science curricula is that teachers should encourage children to develop positive attitudes toward organisms and nature mainly by enabling them to directly experience organisms and their environments. Children seldom come across toads and their image of the animals is not very positive. The following study presents the development of a Toad Attitude Questionnaire (TAQ), and its results gathered from a sample of 195 primary school children (grades 6–9). Factor analysis produced three meaningful factors which were separately analysed according to students' gender, grade and direct experience of toads. Results show that, on the naturalistic and moralistic attitude dimension, girls rate higher than boys, while according to direct experience, the moralistic attitude dimension in contrast to naturalistic and negativistic attitude dimensions produces no significant difference. We also found significant differences across grades with regard to ratings on the naturalistic attitude dimension.

Keywords: *attitude, animals, toads, direct experience*

INTRODUCTION

Children's image of toads is not a very positive one. Of all amphibians commonly found in Slovenia, it is mainly toads that seventh graders perceive as organisms that can infect a person and give them warts. They generally dislike them and report a high level of disgust toward them (Tomažič, 2009). There are several potential causes for that. Firstly, toads are mainly nocturnal and children rarely come in contact with them. Secondly, the main sources of information about toads are children's parents and grandparents, and TV documentaries, while children acquire only limited information in school. In the last decade there has been increased research of attitudes toward different animals and animal groups (Barney et al. 2005, Thomson and Mintzes 2002, Lucas&Ross 2005, Prokop & Tunnicliffe, 2008). But relatively few articles have been published about the attitude toward amphibians or amphibian species (Tomažič, 2008), although they belong among the most endangered animal groups (http://amphibiaweb.org/). In a research conducted by Tomažič (2009), only between 16% and 18% of seventh graders had direct experience of toads. Children who had already been in direct contact with animals, reported more favourable attitudes as well as lower levels of fear and disgust toward them. In the following study a psychometrically valid scale has been developed, which the author used to assess the attitude of children of different age toward toads, the difference in ratings according to the gender of respondents, and differences according to prior direct experiences with animals.

METHODS

A Toad Attitude Questionnaire (TAQ) was constructed on a basis of other research which employed Kellert's typology (Kellert 1985, Barney et. al., Mintzes & Tompson 2002). A single animal species was selected because measuring a generalised attitude toward amphibians would not yield concrete or valid results (e.g. thinking about turtles or frogs –the prototypical species – when rating amphibians). In September and October 2009 a total of 195 students from three primary schools attending grades 6–9 (aged 10–14) completed the TAQ that consisted of 35 items. The questionnaire was submitted to Factor analysis (with Varimax rotation). After the initial analysis, we decided to retain 25 items that produced three meaningful factors. Cronbach's alpha for the total scale of 25 items was 0.88. Cronbach's alpha for the first factor was 0.88 (nine items), second factor 0.80 (eight items) and third factor 0.74 (eight items). KMO of 0.876 and Bartlett's test of sphericity (1618.5, df=300, p<0.001) supported the use of factor analysis. Total variance explained by three-factor solution was 47.8%. The first extracted factor accounted for 28.8% of total variance.

RESULTS

Factor 1 can be interpreted as naturalistic (scientific), where students rated their interest in the physical attributes and biological functioning of animals and their interest in direct experience of animals. Factor 2 can be interpreted as negativistic, where children expressed an orientation toward active avoidance of animals as a result of disliking, fear or disgust. Factor 3 encompassed statements of moral and utilitarian attitudes, i.e. concern about the right or wrong treatment of animals and the importance of animals to humans. Statistically significant differences between different grades were found only for factor 1 (Kruskall-Wallis test: χ^2=10.830; df=3; p=0.013). There were no statistically significant differences between students' average ratings for each factor according to different schools (Kruskall-Wallis test: all p-values above 0.05). A total of 37% of all students reported direct experiences with animals. There were no statistically significant differences in direct experience of toads between boys and girls (χ^2=0.777; df=1; p=0.378). Statistically significant differences between student ratings according to previous direct experience of toads were present for factors 1 and 2. Students with no direct experience of animals rated significantly lower on those two factors than students who reported having direct experience of animals (Mann-Whitney U test: both p<0.001). With regard to factors 1 and 3 girls scored significantly higher than boys (Mann-Whitney U test : p=0.007 for first factor; p<0.001 for third factor).

CONCLUSION

Results show that the scale can be used across grades 6–9. Although the results in different grades are comparable, it is obvious that older students are not as eager, or motivated, to study toads as students of lower grades. This interest is diminishing from sixth to ninth grade (from average 3.4; SD=1.00 to 2.8; SD=0.76). Direct experience also strongly affects students' ratings in the first two factors which may influence students' willingness to learn about animals. Students should therefore, in the course of primary education, have the opportunity to directly meet and learn about animals in order to develop appropriate attitudes toward them. Teachers should try to help students to overcome negative feelings toward animals, which can be effectively accomplished mainly through direct experience (Tomažič, 2008).

HOW DO LEARNERS IN DEVELOPED AND DEVELOPING COUNTRIES RELATE TO ENVIRONMENTAL ISSUES?

Ricardo Trumper

Department of Science Education, Faculty of Science,

University of Haifa, Israel

ABSTRACT

The research questions dealt with students' (a) hopes and visions for the future of the environment, (b) personal engagement in the environmental protection issue, and (c) interest in learning about environmental challenges, regarding their countries' degree of development. In the framework of the ROSE project, attention was focused on students' responses to sections related to environmental issues. The findings showed that students in medium and low developed countries are more:

- concerned and optimistic about environmental problems;
- personally and collectively involved in environmental issues;
- interested in learning environmental topics.

Keywords: *Environmental education, attitudes to environment, interest in environmental issues.*

INTRODUCTION

The issue of students' attitudes toward environmental issues has been evaluated by a number of authors, but few systematic studies on environmental concern and attitudes across countries have been done. According to Inglehart (1990), the shift toward environmentalism in the Western world was linked to a post-materialist shift in cultural values. Thus, it was presumed that high levels of environmental concern existed only among people in developed countries. This assumption has been challenged by the results of an international survey on environmental values conducted by Dunlap et al. (1993) which showed that citizens of many developing nations were highly concerned about the state of the environment.

Nowadays, there is a general consensus that environmental education should pay particular attention to students' attitudes and interests, because their level of knowledge and comprehension seems to increase with their concern. Ballantyne and Packer (1996) found environmental conceptions to be very important in the adoption of attitudes and environment-related behaviors. Many students appear to have misconceptions of certain environmental issues. There is a large body of literature on the relationships between knowledge, and attitudes and behavior toward the environment, but findings continue to be mixed regarding relationships among these variables.

Most of the existing studies regarding environmental attitudes were carried out in developed countries. We think there is a need for studying and comparing students' environmental attitudes and interests in developed and developing countries as indicators for environmental behavior, in order to identify what contributions school science education can make in improving these attitudes.

METHOD

The data were collected through the ROSE survey. ROSE, the Relevance of Science Education, is an international comparative research project that was conducted in 2003 and 2004.

In this presentation attention is focused mainly on students' responses to sections and items related to environmental issues: students' attitudes to environmental challenges and their interest in learning about environmental topics. This study comprised 36,728 students from 34 different countries, most of them 15 years old, representing the population of compulsory last-year students in the different countries.

For all of the analyses we used the Human Development Report (HDR) (UNDP, 2003) published annually by the United Nations Development Program (UNDP). In each HDR the countries are ranked according to the Human Development Index (HDI).

The first two parts of this study refer to the section of the questionnaire headed "Me and the environmental challenges". This consists of 18 statements prompted by the question "To what extent do you agree with the following statements about problems with the environment".

RESULTS

Are students' visions for the future of the environment related to their countries' degree of development?

Two items were intended to tap into respondents' future images of the environment: D2 - Environmental problems make the future of the world look bleak and hopeless, and D7 - We can still find solutions to our environmental problems.

On average the students in all the countries agreed with the statement that the future of the world looks bleak and hopeless due to the environmental problems (item D2). Despite that, item D7 displayed a very hopeful profile meaning that students in all countries agree strongly that we can still find solutions to our environmental problems. Nevertheless, looking at the relationship of students' responses for these two items with the HDI, we see that:

1. For D2, an inverse relationship with a Pearson product moment correlation of .674 ($p < .01$), that is, the higher the level of development in a country, the lower students' agreement that the world looks "bleak and hopeless" due to the environmental problems,
2. For D7, an inverse relationship with a Pearson product moment correlation of .486 ($p < .01$), that is, the higher the level of development in a country, the lower students' agreement that we can still find solutions to our environmental problems.

Is students' personal engagement in the environmental protection issue related to their countries' degree of development?

Some items seem to have in common a lack of concern for the environmental issue indicating that environmental problems are overstated (D3: Environmental problems are exaggerated, and D8: People worry too much about environmental problems).

Students' responses showed that, in most countries they disagreed with statements indicating that environmental problems are overstated, although none of them disagreed strongly. There is an inverse relationship between students' responses and the HDI, with a Pearson product moment correlation of .626 ($p < .01$), that is, the higher the level of development in a country, the less students agree that environmental problems are overstated.

Other items describe another aspect of lack of concern, distancing the individual from environmental problems, and sharing an expression that solving these problems is somebody else's job (D1: Threats to the environment are not my business, D11: It is the responsibility of the rich countries to solve the environmental problems of the world, and D13: Environmental problems should be left to the experts).

Students' responses showed that in all countries they disagreed with statements indicating that someone else had to solve environmental problems. There is a somewhat direct relationship between students' responses and the HDI, with a Pearson product moment correlation of .368 ($p < .05$), that is, the higher the level of development in a country, the more students agree that solving environmental problems is somebody else's job.

By contrast, there are items which describe a tendency to become involved in the issue, suggesting that environmental problems can still be overcome, a belief that every one can make an important difference, and evincing some willingness to act. We differentiate personal involvement (items D5: I am willing to have environmental problems solved even if this means sacrificing many goods, and D6: I can personally influence what happens with the environment) from collective involvement (items D7: We can still find solutions to our environmental problems, D10: People should care more about protection of the environment, and D12: I think each of us can make a significant contribution to environmental protection).

On the one hand, students showed little conviction about statements conveying personal involvement in the environmental issue. On the other hand, students showed a greater conviction about statements conveying collective involvement in the environmental issue. Looking at the relationship of students' responses with the HDI, we see that:

1. The higher the level of development in a country the less students are personally involved [Pearson product correlation moment of .444 ($p < .01$)].
2. The higher the level of development in a country the less students are collectively involved [Pearson product correlation moment of .571 ($p < .01$)].

Is students' interest in learning about environmental challenges related to their countries' degree of development?

In section E students were invited to indicate how much they "want to learn about" a series of subjects given in 108 statements, 12 of them addressing environmental protection.

Most developed countries' students scored low, absolutely and relatively, meaning that they did not regard environmental protection as a matter of particular interest, while students in developing countries seemed willing to learn about environmental issues. We got a strong inverse relationship between students' interest in learning about environmental issues and the HDI, with a Pearson product moment correlation of .866 ($p < .01$): the higher the level of development in a country, the lower the students' interest.

CONCLUSIONS

The most salient feature of the findings of this study is a sharp distinction between high developed countries from one side, and medium and low developed countries from the other side. We found that students in medium and low developed countries are:

- more concerned and optimistic about environmental problems;
- more personally and collectively involved in environmental issues;
- more interested in learning environmental topics.

These differences suggest implications for the environmental science education. We think it is important to develop environmental science education programs that are based on each country's own ecological, cultural, political, educational, and economic context.

THE INFLUENCE OF TEACHER GENDER ON STUDENTS' ENGAGEMENT AND ACHIEVEMENT IN SCIENCE: A NORWEGIAN EMPIRICAL STUDY

Eyvind Elstad

University of Oslo

eyvind.elstad@ils.uio.no

Are Turmo

University of Oslo

are.turmo@ils.uio.no

ABSTRACT

The purpose of the study was to explore relationships between teachers' gender and a range of variables relating to adolescent students' perceptions of their classroom engagement, quality of teaching and responses to their teacher, and their own achievements in science (Elstad & Turmo, 2009). A cross-sectional survey of 798 Norwegian students showed the potential influence of the gender of the teacher on engagement, motivation, volition, and learning outcomes, which was estimated after they had known their teachers for six months. The conclusion is that there are interesting interactions between the gender of students and the gender of science teachers in high school along some dimensions. The statistical significant findings support the gender-stereotypic notion, while there are also tendencies supporting the gender-opposite notion. However, in most instances significant interactions between teacher gender and student gender are not established. The conclusion is more nuanced than in many earlier studies.

Keywords: Teachers' gender; teacher behaviour; student engagement; student achievement.

INTRODUCTION

In the research literature about the significance of teacher's gender we find – among many other distinctions - three important notions: *the gender-stereotypic notion*, *the gender-opposite notion* and *the gender-invariant notion*. *The gender- stereotypic notion* is that girls do better (across different school subjects) in classes taught by women, and boys fare better in classes taught by men (Noddings,1984). *The gender-opposite notion* implies that there are emotional bonds between the teacher and students of the opposite gender, yet it is difficult to find clear evidence of this (Einarsson & Granström, 2002). *The gender-invariant notion* is the idea that motivation, volition, academic work, engagement and attainment do not vary as a function of teacher gender. It is the nature of pedagogy that is influential and not the gender of the teacher delivering the instruction. Supporters of this hypothesis claim that there is only minor evidence to assert that a teacher's gender makes any difference to students' educational attitudes and attainment.

METHODS

The students responded to a survey that scored learning strategies; motivation/self-discipline; teacher conduct/class environment; teacher-student interactions; and parent engagement. In line with newer research about motivation, learning strategies and self-regulation, we have focused on subject specific aspects connected to a school subject, in this case science: (1) classroom management (2) exertion of academic pressure to learn in the classroom (that Norwegian school authorities wish should characterize the learning situation). Classroom interaction also demands that the teacher (3) handles social relations so that reciprocal relational trust is established. The study is done within the test theoretical paradigm where psychological constructs are measured by sets of individual questions (items) that are asked of the students. We discuss constructs that have worked sufficiently well from psychometric quality criteria. The questionnaire consisted partly of already established measurement instruments that were adjusted to a science subject context, and partly of newly developed instruments based on a pilot study that was implemented in fall 2006. Students were asked to answer the items using the five-point Likert-scale from totally disagree (1) to totally agree (5). In the analysis, we compare average values for girls and boys being taught by their respective female or male science teachers.

RESULTS

The results show that boys evaluate their own grade levels significantly higher than girls do in science. However, the difference is correspondingly large within the two groups of students taught by female and male teachers, respectively. When it pertains to the constructs connected to student engagement, we find statistically significant gender differences in the groups for 6 of 14 tests. Regarding the construct of mastery motivation,

there are no gender differences found in the group with female teachers, but there are, however, a significant difference in the group taught by male teachers. The comparison of values in the group with female science teachers shows that the values for girls taught by male teachers are somewhat higher, but they are somewhat lower for boys. In other words, we found indications of interactions between teacher and student gender along the lines of the gender-opposite notion. However, it is important to note that none of the interactions between teacher and student gender among the constructs in this category are statistically significant. One should, therefore, be very careful regarding the possibility of capitalising on chance when interpreting these findings. Boys show tendencies to experience the teacher's exertion of classroom management more effectively with male teachers, while girls experience this aspect somewhat more positively with female science teachers. Furthermore, there are tendencies that girls experience a teacher's ability to build reciprocal trust more positively by female teachers, while boys experience

male teachers more positively here. Here we find a significant interaction effect between teacher gender and student gender ($p<0.05$). This finding, in other words, supports the gender-stereotypic notion. The results for the construct *Disengagement* show that boys react significantly less negatively under pressure when relating to male science teachers. Here we find a statistically significant interaction effect between teacher and student gender $p<0.05$). There is also a weak tendency for girls, to a larger degree, to want pressure to learn and control when they are taught by female science teachers, and boys responded correspondingly when they had male science teachers. The interactions in this category, in other words, point to the gender-stereotypic notion. The last category of constructs deals with parental influence. It is naturally easier for students to distance themselves from their parents as they grow older. The results show that girls who are taught by male science teachers report a significantly greater involvement from parents than girls taught by female science teachers. For this construct we find a statistically significant interaction effect between teacher and student gender ($p<0.01$). If we interpret this as compensatory behaviour displayed by parents and students, we have an example of gender-stereotypic notion. However, it has to be underlined that also other interpretations are possible regarding this point.

CONCLUSION

We find support for the gender-invariant notion in most instances. However, the three statistically significant interaction effects between teacher and student gender are all in line with the gender-stereotypic notion. Furthermore, we find tendencies supporting the gender opposite notion in some instances (Mastery motivation, Influencing performance norms in class). However, these interactions between teacher and student gender are not statistically significant, and very careful interpretations are therefore needed. Implications of these findings will be elaborated in the presentation.

akkus@gazi.edu.tr

ABSTRACT

In developing thinking skills, the role of the questions is immense. In this study; the cognitive level of the questions in 9^{th} and 10^{th} grade chemistry books are examined according to Bloom's taxonomy. Also, the opinions of students and teachers about questions in textbooks are determined. This study was conducted with 88 chemistry teachers who worked in 58 secondary schools and 1165 students in 2008-2009. The results of the study reveal that; i) textbooks highly involve lower cognitive level questions. ii) students aren't interested in questions. iii) variety of questions and different levels of cognitive domain aren't included in textbooks.

Keywords: *Bloom's taxonomy, textbook, question analysis*

INTRODUCTION

The questions which are on the higher order cognitive level lead students to question and think in higher levels (Hotiu, 2006). The fact that the students face with the questions which assess not only their learning at the same level, but also their learning at different levels will help them in gaining higher order thinking skills (Karamustafaoğlu et al., 2003). In a study carried out by Davila and Talanquer (2010), it was found that textbooks highly involve application level questions. In their study, it was found that synthesis and evaluation levels of cognitive domain were used nearly with the proportion of 5% in three general chemistry textbooks. In a study conducted by Risner et al. in 1991, it was detected that there were many low level cognitive questions with the proportion of 60% in science textbooks and higher level of cognitive domain weren't used in the questions. The questions included in textbooks should be in a type that make students curious and encourage them to investigate. It is as important as the cognitive level of questions. In the textbooks the questions enabling students' critical thinking should be used.

The primary purpose of this study is to detect the level of the questions that are present in 9th and 10th grade chemistry textbooks according to Bloom's taxonomy. The secondary purpose of this study is to detect the opinions of the students and chemistry teachers about questions in chemistry textbooks.

METHODS

In this study, content analysis was used to determine the cognitive level of questions and survey design was used for students' and teachers' opinions. A questionnaire that was reliability factor was 0.82 and a criteria table for the analysis of the cognitive level of questions was used as a tool.

This study was conducted with 88 chemistry teachers who worked in 58 secondary schools in the 8 district of Ankara and 1165 9^{th} and 10^{th} grade students. In this study the cognitive level of the open-ended and multiple choice questions in chemistry textbooks that belong to years that was used in 2008-2009 fall and spring semesters were examined according to Bloom's taxonomy.

The cognitive level of the questions used in chemistry textbooks was examined by the researchers and a graduate student by using a criteria table. The criteria table was formed by the help of the related literature in order to determine the cognitive level of 286 questions in textbooks. It was composed of the objectives of the cognitive domain, keywords to determine the cognitive level of the questions and chemistry questions that could be used to determine the cognitive level of the questions. It was controlled by the experts in chemistry education to determine whether it was appropriate for the study or not.

A Likert-type scale was formed by the help of the related literature in order to get the opinions' of the students and teachers about the questions used in the textbooks. Content validity of the questionnaire was assessed by the experts in chemistry education and the internal consistency of the questionnaire was found 0.82 by using Cronbach alpha. In the questionnaire students and teachers were asked whether they found the level of the questions appropriate and interesting and whether they found variety of the questions adequate or not. Also they were asked whether they found variety of the questions adequate or not.

RESULTS

When examined the distribution of the cognitive level of the questions, it is found that knowledge level questions are used on the 9th grade chemistry textbook with the proportion of 29% and application level questions are used on the 10th grade chemistry textbook with the proportion of 83%. It is detected that higher levels of the cognitive domain are used on the 10th grade chemistry textbook with the proportion of 7%. Also 20% of 9th and 34% of 10th grade students stated that they never compare with curious and interesting questions. When examined the distribution of the teachers' opinions; it is stated that the level questions aren't enough to develop higher order thinking skills for 45% of them, variety of questions and different levels of cognitive domain aren't included in chemistry textbooks for 50% of them.

CONCLUSIONS

Considering the results of this study, it can be concluded that by using higher cognitive level questions more on textbooks, the higher order thinking skills of the students can be increased. So the questions can be more interesting and challenging for them. Because of this it is proposed to use higher order thinking skill questions more in textbooks.

ABSTRACT

Existing instruments designed to measure primary teachers' attitude towards science and technology often poorly define the complex construct of attitude resulting in unreliable and non-interpretable measurements. The construct-validity of the instrument presented here is achieved by a thorough theoretical underpinning of the construct of attitude. The result is a comprehensive framework consisting of relevant components of attitude which is used for the development of the instrument. An important distinction is made between teachers' personal attitude towards science and technology and their professional attitude towards the teaching of these subjects. Both the conceptual framework and the instrument will be presented.

Keywords: *Attitude; science & technology; teacher education; Primary school teachers; Questionnaire development.*

INTRODUCTION

The study on attitudes towards science and technology has received considerable research attention over the last decades. Its importance is emphasized by the growing evidence of a decline in the interest of young people to pursue a scientific career, research indicating the scientific ignorance of the general public, and an increasing recognition of the importance of scientific knowledge (Osborne, Simon and Collins, 2003). Most students have already excluded the choice of a science or technology study during their primary school period (Osborne and Dillon, 2008). Crucial in determining positive attitudes of students in their primary school period are school teachers (Harlen and Holroyd, 1997). However, the attitudes of (pre-service) primary school teachers towards science and technology are mostly negative (Harlen and Holroyd, 1997). This is problematic because these teachers spend less time on these topics in their classroom, rely more on standardized methods and top down instruction, and are less able to stimulate students' attitudes. From the above, it follows that explicit attention to the attitudes of (pre-service) primary teachers towards science and technology is of fundamental importance for the professionalization of these teachers within the science and technology domain (Haney, Czerniak, and Lumpe, 1996).

Although such attitudes have been investigated in a range of scientific studies, scientific progress in this field remains slow due to several major theoretical and methodological issues (Bennet, Rollnick, Green, and White, 2001). Most importantly, both in research and in educational change projects the concept of an attitude towards science is often poorly articulated. Many reported studies do not, or incompletely, theoretically define the construct or they do not articulate the different components of attitude that they are measuring. In addition to (and also because of) the poor theoretical definition of what constitutes teachers' attitudes towards science and technology, many studies use measuring instruments that are poorly designed. The instrument construction and construction of individual items is poor and many studies fail to pilot-test, validate and evaluate the instrument according to the current psychometric standards. These two methodological problems have several consequences. First, interpreting results is difficult because it is not clear what is actually being measured. Second, comparing results between studies is hard due to the fact that these studies measure different aspects, components or objects of attitude. Thus until now no review compared studies on the basis of what was actually measured.

This presentation will show the development of an instrument to measure primary teachers' attitude towards (teaching) science and technology. We will remedy the issue of poor theoretical definition of attitude by trying to disentangle the construct in a theoretically sound manner. In order to do so a comprehensive overview of components relevant to the construct of attitude towards (teaching) science and technology is composed based on theory and literature. These components form a conceptual framework that will be used to organize the multitude of different attitudinal concepts that have been measured in previous research and will incorporate these concepts when relevant. The instrument presented here is based on the conceptual framework and will be validated using quantitative methods. This presentation will show the different development steps and the resulting instrument.

METHODS

The framework for the construct of attitude was based on relevant theoretical models of attitude. This framework was used as a filter to select all possible components and attributes of attitude that have been measured in the research on attitudes towards science and technology over the last 25 years. In addition to this extensive theoretical underpinning of the construct of attitudes, semi-structured interviews were held with 71 preservice or inservice primary teachers asking these teachers about their personal attitudes towards science and technology in general, but also about their professional attitudes towards the teaching of science and technology. Based on the conceptual framework and results from interviews an instrument was developed to measure primary teachers' attitudes towards (teaching) science and technology. The instrument was pilot-tested using quantitative (factor analysis) and qualitative methods (feedback from (preservice) teachers).

RESULTS

Results from factor analysis and interviews support the relevance of the framework for the development of the instrument. Factor analysis reveals a factor structure which supports the structure of the framework. In addition, the factorial structure for personal attitude and professional attitude was comparable, although emphasizing different accents. Feedback from teachers supported the distinction made between personal and professional attitude.

These results are promising for successful development of the instrument and provide useful suggestions and considerations for future work on validating the instrument.

CONCLUSIONS

The framework presented here proved a successful tool for the development of an instrument, but also for the comparison and review of previous studies on attitude towards science and technology. Central to the framework for the construct of attitude are cognitive beliefs and affects. These components are flanked by the concepts of self-efficacy, perceived context factors, locus of control, and interest, which have proven to be indispensable concepts when investigating attitudes. An important distinction present in theoretical models, but not instruments, concerned the difference between a teachers' personal attitude towards science and technology and that persons' professional attitude towards the teaching of science and technology. The relevance of distinguishing between these attitude objects is also supported by the results from the interviews. This conceptual framework proved to be a solid underlying theoretical base for instrument development. We therefore conclude that the resulting instrument has shown to be a promising tool for measuring teachers' attitudes towards (teaching) science and technology.

ABSTRACT

Spiral learning teaching model is one of the active teaching models with 11 steps and 15 objectives. At first, the plan was implemented on a 15-person pilot and an evaluation was conducted by Behrangi's questionnaire. The type of this research is practical and the research method is field study and Cronbach's Alpha test is used for evaluating internal similarity in pilot part in which the results show high similarity of different items. Then the scenario will be performed for 54 university students, whom their assessment will be analyzed by application of the 72-item questionnaire based on objectives through a nonparametric statistical and unidirectional chi Square test and SPSS.

Keywords: *Teaching models; spiral learning; effective education; human values; Socio-cultural values.*

INTRODUCTION

Humans communicate with environment by their five senses and they use these five senses with respect to their needs. Some research showed that 75% of learning has been developed by visual sense and 13% of that is developed by hearing sense and these results show the importance of these two senses in human and also these senses lead to 88% of learning in individuals. We tried to increase learning with involving visual and hearing senses in this model.

METHODS

In the first step, learners achieve teacher's mental concepts through using audio-visual clips, then they will be divided into groups and teaching will be continued by asking individual and collective questions. Finally, learners write down important items and submit them to the teacher; on the next session, written notes will be returned back to the learners to be reviewed and subsequently, the teacher corrects them and mentions important issues on that regard to learners Steps of spiral learning model: this model includes 11 steps and it is called spiral learning because of continuity of the steps and those steps are:

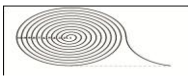

Diagram 1 . model of spiral learning

1) Audio-visual clips 2) Teacher's question 3) Learner's answer 4) Grouping 5) Individual and collective questions of teacher (accompanying with image and sound) 6) Freedom of mind 7) Writing what have been learnt 8) Comprehensive Study 9) Revise and review notes 10) A teacher's conclusion 11) A feeling of satisfaction.

GOALS OF TEACHING THE SPIRAL LEARNING

The given model consists of 15 goals that are measured and analyzed by a questionnaire, the goals are not offered on the basis of their importance or priority, however they are considered important goals according to the researchers and play a major role on application of this model. These goals are: 1-Conceptualization 2-Creativity 3-Team work (Synergy) 4-Individual work 5-declaring thoughts and achieve a hypothesis 6-Familiarity with terms 7-Applying images 8-Knowledge 9-Interpreting and critique 10-Learning 11-Connect unfamiliar concepts With familiar ones 12-Feel trust 13- Extending information and the capability to maintain 14-Pre-Organizer 15-Scientific thoughts

RESULTS

In this research, 15 students of Sciences and Research University in the field of educational management are studied in learning environment and they have considered teaching process in order to evaluate the effect of this model on learning of learners and finally, educational effects of this model is investigated by standardized questionnaire of Dr.Behrangi and internal similarity of variable was calculated by Cronbach's Alpha and this was 0.96. To control the variables and to avoid the effect of teacher on group, students of educational management for semester of 1999 and 2009 in M.A degree of Azad management and economic university of sciences and research ministry have conducted an opinion poll by presenting seminar and questionnaire. Type of research is practical and research method is field study; descriptive statistic test (frequency and percentage) and nonparametric statistical and unidirectional chi Square test is used to evaluate the significance between the opinions of persons. Whereas the questionnaire has 72 items, each item is analyzed and they are shown in the following table.

Question number	Sig level	Chi-square	Question number	Sig level	Chi-sqare	Question number	Sig level	Chi-square
1	0.00	24.11	25	0.04	6.33	49	0.00	30.33

24	0.001	14.77	48	0.00	22.11	72	0.00	17.44

CONCLUSIONS

Spiral learning model is not separate from other teaching models but it may make a new and incorporated view of them. In our questionnaire, we considered 72 ideal speeches and our goal is to reach them and these speeches indicate our ideal and expected condition. For this reason, when the questionnaire is generalized to the university, speeches were analyzed to evaluate the ideal condition and current condition and also investigating the opinions of people using chi Square test and the results show that we are approaching to ideal and favorite condition which we were expecting.

INTERDISCIPLINARY EDUCATIONAL APPROACH TO THE SCIENCE OF HUMAN VOICE

Ivo Verovnik

National Education Institute of Slovenia

ivo.verovnik@zrss.si

ABSTRACT

Human voice and spoken language are the most important means of everyday interpersonal communication. Despite this fact the scientific background of human voice production is often neglected in school curriculums. There are several reasons for such a situation. The structure of speech organs and the mechanism of voice production are relatively complicated and the scientific explanation of these processes requires an interdisciplinary approach. There is also a lack of didactic materials to support this type of lessons. The developed didactic aids for this purpose using powerful electronic and computer technology, which is nowadays available also to the teachers and students, will be presented.

Keywords: *human voice, speech organs, interdisciplinary, didactic material, computer technology.*

INTRODUCTION

From historical point of view, sound was already an important field of scientific research especially in previous centuries. In recent years a big step forward has been made in this sphere of activity by the development of computer technology. Contemporary information and communication technology enables processing of huge amount of data, which is needed to store and analyse sound records of a human voice.

Efficient computer technology is today available also in schools and school laboratories. What was once very expensive equipment, which was available only to the well equipped acoustic laboratories, can be used today widely by the teachers and students.

School teachers can plan and prepare their lessons in more attractive way for the students, especially when taking into account the fact that singing voice and music as a special sound phenomenon, is one of the most important means of entertainment in our everyday life.

Despite the fact that human speech and hearing is still the most important for our interpersonal communication, in school curriculums the scientific background about these phenomena is often neglected. The main reason for this situation is on one hand the complexity of the scientific background about speech and hearing and on the other hand there is an absence of suitable didactic supporting material.

METHODS

Examples of the developed didactic material about sound, human voice and hearing, based on the use of computer technology, will be presented. One can find more detailed description of this material in the references. A lot of different software can be used for editing and analyses of sound records. Some of them are professionally designed and relatively expensive (Adobe Audition), but there are also free and open source programs, which can serve for the same purpose (Audacity).

The different vowels used in human speech are produced in vocal tract, starting roughly at the vibrating vocal cords in larynx and ending at the lips. This is done mainly by changing the shape of the vocal tract and consequently its resonant frequencies are changing. Some of the overtones are reinforced with respect to the different resonances of the vocal tract. The mechanism is relatively complicated to understand so that interactive electro-mechanical model helps in understanding the basics. The corresponding experiment, showing synthesized production of different vowels will be presented.

RESULTS

The core of the developed material is included in the book Acoustische Phänomene (Mathelitsch & Verovnik, 2004) together with enclosed CD-ROM containing the selected sound files, discussed in the book.

More than hundred sound examples from CD-ROM can easily be played in a classroom. The computer technology allows that sound files can be analyzed on a computer, for instance, with regard to their spectral content.

The book contains short explanations of the sound examples and of the underlying sound-production mechanisms. It can therefore also be used as a kind of encyclopaedia, offering information on specific sound phenomena.

CONCLUSIONS

The aim of the developed didactic material is to make explaining the production and characteristics of different voices representing the basic of all spoken languages easier and more effective. The presented interdisciplinary educational approach has an important meaning also in the sense of linking the contents from different school subjects such as physics, biology, mathematics, informatics, languages and music.

ABSTRACT

The concepts of diffusion and osmosis, which students encounter in different biology courses, are closely related to certain concepts of physics and chemistry. Both however may pose a difficult challenge to students, when it comes to their understanding. In our study, a modified two tier Diffusion and Osmosis Diagnostic Test (DODT) was administrated to pre-service teachers. In addition, we asked the prospective teachers if they had conducted any experiments regarding either of the concepts in high school to determine whether this could affect their performance in the test. Results suggest that students generally lack thorough understanding of the two concepts, which is consistent with the findings of previous studies. We also found that students who had conducted experiments with diffusion and osmosis in high school achieved better test scores than students who did not have, or did not recall having this experience.

Keywords: *diffusion, osmosis, pre-service teachers, understanding*

INTRODUCTION

The concepts of diffusion and osmosis are important for understanding life processes. They are introduced in many biology courses (e.g. general biology, cell biology, physiology, ecology). They are also closely related to concepts of physics and chemistry, such as permeability, solutions, and the particulate nature of matter (Friedler et al., 1987).

Researchers report that students generally have many inaccurate conceptions and misconceptions about diffusion and osmosis, and that they find these two concepts difficult to differentiate (Friedler et al., 1987; Friedrichsen & Pallant, 2007). Odom and Barrow (1995) believe that students have difficulties with the concepts of diffusion and osmosis because: (1) formal reasoning skills are required to understand these two processes, (2) making sense of these constructs subsumes understanding of other technical concepts, e.g. solution, solute, solvent, semi-permeability, molecular movement, net movement and direction of movement, and (3) there is often confusion between the vernacular and scientific usages of terms, e.g. pressure, concentration and quantity. In our study, we assessed pre-service primary school biology/home economics and biology/chemistry teachers' understanding of diffusion and osmosis. In addition, we compared test scores according to the year of study, study programme and whether or not the students had done experimental work on the two concepts in high school.

METHODS

A total of 168 first, second and third year pre-service teachers completed the modified Diffusion and Osmosis Diagnostic Test (DODT) that consisted of 12 two-tier items (Odom & Barrow, 1995). The questions were multiple-choice. The first tier required content and the second tier required a reason for the first response. In our version of the questionnaire, we changed two questions. Split-Half Reliability of questionnaire was 0.73 and difficulty of questions ranged from 10% to 89%.

The research was conducted in three academic years (2007/2008, 2008/2009 and 2009/2010). Altogether, there were only 10 (6%) male students. Students were also equally distributed according to study programme and year of study (χ^2=0.668, df=2, p=0.716). The majority of the students finished gymnasium (n=156; χ^2=0.681, df=2, p=0.712). The average age of first year students was 19.3 (SD = 1.1) years, while the averages for second and third year students were 20.6 (SD = 1.2) and 21.9 (SD = 1.3) years, respectively. In addition, we asked students whether they had conducted any experiments regarding the concepts of diffusion and osmosis in high schools in order to find any differences in their knowledge. 163 students answered this question. 32% of first year, 48% of second year and 36% of third year students stated that they had conducted such experiments in high school (χ^2=3.958, df=4, p=0.412).

RESULTS

In the first tier of the test, the range of correct answers for first year students ranged from 16.7% to 83.3%, for second year students from 16.7% to 100%, and for third year students from 41.7% to 91.7%. When both tiers were combined, the correct responses were significantly reduced to the range of 0% to 38.9% for first year students, 0% to 61.1% for second year students and 0% to 55.6% for third year students. There were statistically significant differences between the averages of students' correct answers for the first tier across different years of study; ANOVA: $F(2,165) = 17.21$, $p < 0.001$). The same applied for average correct answers of both tiers combined; ANOVA: $F(2,165) = 15.53$, $p < 0.001$). Differences were present on account of first year students, whose achievement was significantly lower than the achievement of second and third year students (Tukey HSD: $p < 0.001$). Given these facts we can conclude that the knowledge about the two concepts students may have gained in high school was superficial.

When we analysed students' answers according to whether or not they had conducted experiments about the two concepts in high school (*Yes / No / I don't remember*), we found statistically significant differences in the average students' achievement scores on the first tier (ANOVA: $F(2,160) = 7.57$, $p = 0.001$) and on both tiers combined (ANOVA: $F(2,160) = 5.33$, $p = 0.006$). On the first tier, multiple comparisons test (Tukey HSD) showed that the main difference was on account of students who reported that they had conducted experiments regarding diffusion and osmosis in high school ($p = 0.002$ for yes/no comparison, $p = 0.009$ for yes/don't remember comparison, and $p = 0.765$ for no/don't remember comparison). But when we compared results from both tiers combined, the main difference was found between students who stated that they had and those who had not conducted experiments about diffusion and osmosis in high school ($p = 0.004$ for yes/no comparison, $p = 0.465$ for yes/don't remember comparison and $p = 0.100$ for no/don't remember comparison). Results from the first tier indicate that conducting experiments in high school could be the reason for the better achievement of some students. But the results for both tiers combined do not yield an identical conclusion, as described before. Namely, the results of students who had conducted experiments in high school did not significantly differ from the results of students who did not know (remember) whether they had conducted experiments.

CONCLUSIONS

Results suggest that students generally lack thorough understanding of diffusion and osmosis, which is consistent with the findings of previous studies. Higher-year students showed better understanding of both processes, although not as high as we had anticipated. Results indicate that conducting experiments in high school could be the reason for the better achievement of some students. Further research is needed to gain a more detailed insight into factors that may or may not influence the comprehension of the said two concepts.

THE PRESENTATION OF S&T-SCIENTISTS IN NORWEGIAN NEWSPAPERS

Kristoffer Barbøl Vikebak

Sciences
University of Oslo

k.b.vikebak@matnat.uio.no

S&T-SCIENTISTS IN NEWSPAPERS

It is assumed that the presentation of scientists in media influences the perceptions youth have of educations within science and technology (S&T), thus influencing the education choices youth make. The presentation of media sources holding higher degrees in science and technology. Norwegian newspapers has therefore been the subject of study in a Master's Thesis in Media Science. By combining quantitative and qualitative content analysis, the study revealed that newspapers portrayed S&T-scientists as focused on their area of research, and when moving away from it, their connection to S&T-subjects becomes more unclear.

Keywords: *Educational choices*, *Role models, Science journalism.*

INTRODUCTION

The processes that lie behind youth's choice of education are many and complex. Family, friends and talents are of great importance (Ramberg, 2006). So is the media, both when it comes to entertainment in media and the news. News media are in many ways people's eyes to the world outside and the way in which they present S&T-scientists has a great impact on what kind of impression youth have of scientists. As a result, news media may influence the choices youth make when it comes to choosing an education.

THEORETICAL FRAMEWORK

Educational choices are in the late modern society more a choice of who you want to be than what you want to be (Giddens, 1991; Schreiner, 2006). Youth's choice of education becomes a choice of identity and the impressions they have about different professions influence their choices greatly. Their impressions are therefore of importance when choosing an education (Schreiner, 2006). Norwegian youth generally find S&T-educations uninteresting as a career alternative (Schreiner, 2006).

Newspapers are often the starting point for news, and other news media get their news from newspapers (Lund, 2000). Despite the general decrease in circulation, newspapers are still one of the main bearers of news. The presentation of S&T-scientists in newspapers is therefore of importance when it comes to the choice regarding education youth make.

METHOD

The three cases examined were chosen because they got major media coverage and were closely related to S&T-subjects. The cases, the landslides in Bergen in 2005, the Climate Settlement during the winter of 2008, and the start-up of the LHC-experiment in CERN in the autumn of 2008, generated over 500 newspaper articles. These articles were subject to a quantitative content analysis. A strategic selection of articles was made based on the results of the first analysis. 48 articles were thus selected for qualitative content analysis with focus on the presentation of S&T-scientists.

The discoveries from this analysis were viewed in the light of science journalism studies, among others Esa Väliverronen's (2001) study of media's use of scientists as sources.

RESULTS AND DISCUSSION

S&T-scientists don't usually play the main role in the news, but when they do, their focus lies mainly on the subject area they are an expert on. Instead, S&T-scientists could have chosen to focus on the broader aspects of their subject field, thereby showing why and how they are important to society. The strong focus on the subject area in itself creates a portrait of the S&T-scientist in the news as less appealing. This is especially the case for younger readers who aren't being made aware how S&T-subjects actually relate to themselves and their own identity.

When S&T-scientists in the news move away from the subject area in itself, it is difficult to see that they are in fact S&T-scientists, contrary to politicians who are clearly politicians even when they address areas that are not particularly political. The reason for this may be that being a S&T-scientist is an unclear role to play. And this is clearly reflected in the news.

A SOUTH AFRICAN PERSPECTIVE FOR IMPROVING LEARNERS' FUNDAMENTAL SENSE OF SCIENCE: AN INTEGRATED TEACHING STRATEGIES APPROACH

Mary Grace Villanueva
Nelson Mandela Metropolitan University
marygrace.villanueva@nmmu.ac.za

Paul Webb
Nelson Mandela Metropolitan University
paul.webb@nmmu.ac.za

ABSTRACT

In light of South Africa's learner performance on international and national assessments such as TIMMS (2003) and PIRLS (2006), as well as the problems of teaching and learning in a second language, there appears to be a primary and pressing need to develop learners' fundamental sense of scientific literacy. Expanding learners' ability to read, write and communicate in science may provide the necessary framework for engaging learners in the critical principles and foundations of the scientific endeavour. As such, this study focuses on equipping grade six and seven science teachers with a strategy that supports reading, writing, talking and 'doing' science through scientific investigations. The study was conducted in two different milieus in the Eastern Cape, South Africa. Quantitative data were collected from the baseline and post-intervention testing of learners' problem solving skills, as well as their literacy skills in English and isiXhosa. Qualitative measures were generated through classroom observations, teacher interviews and learners' science notebooks. The data suggest that the scientific literacy strategy improved the experimental learners' problem solving skills. Progression of learners' literacy skills varied according to each milieu. Teachers' gradual improvements in the use of the model suggest that they were able to use the strategy to support the cognitive and linguistic development of second-language learners.

Keywords: *Scientific literacy; general literacy; reading-to-learn science; writing-to-learn science; classroom discussion; argumentation; scientific investigations; inquiry-based teaching*

INTRODUCTION

In South Africa, science and mathematics teachers face the double challenge of working within the instructional framework of English while their learners are still developing their skills in this language (Setati, Adler, Reed & Bapoo, 2002). As a result, learners' reading, listening, speaking and writing skills in both their first language and English is usually poor (Mayaba & Webb, 2009). Research into educating second language learners affirms that teachers are required to define language and content objectives, as well as plan activities, which are experiential, hands-on, collaborative/cooperative, context embedded and cognitively engaging (Met, 1998; Cummins, 1981). Accordingly, an integrated teaching strategies approach was developed for the dual purposes of providing a pedagogic model for science teachers to implement in their classrooms and to promote learners' scientific literacy in the fundamental sense. The strategy used in this study synthesises various pedagogical approaches such as reading, writing, talking and arguing in science, as well as the 'doing' aspect of conducting investigations. This study investigated whether teachers were able to use the strategy for promoting scientific literacy for second language learners. Furthermore, the study examined what effect the strategy had on the way children engage in the processes and procedures required for scientific investigations, as well as the effect on learners' problem solving and general language and literacy abilities.

METHODOLOGY

The typology of triangulation and the mixed method research approach was supported by a fully mixed, concurrent, and equal status design (Leech & Onwuegbuzi, 2007). Quantitative data were collected from the baseline and post-intervention testing of learners' problem solving skills, as well as their literacy skills in English and isiXhosa. Qualitative measures were generated through classroom observations, teacher interviews and learners' science notebooks. The study was conducted in two different milieus in the Eastern Cape, South Africa. The first setting, in the rural area of Tyumie Valley near the Hogsback Mountains, was comprised of a sample of grade six and seven (multi-grade classrooms) teachers (n=7) and learners (n=168) from five experimental schools and two comparison schools. The second setting, in the urban townships area east of Port Elizabeth, was comprised of a sample of grade six teachers (n=8) and learners (n=675) from six experimental schools and two comparison schools. Mean differences between the experimental and the comparison groups were computed for the Raven's Standard Progressive Matrices (RSPM) and the literacy tests, and the data generated were treated with an Analysis of Covariance (ANCOVA).

RESULTS AND CONCLUSION

The data suggest that the scientific literacy strategy improved the experimental learners' problem solving skills. Both experimental groups demonstrated greater gains than that of the comparison schools; however, statistically significant improvements were only detected in Port Elizabeth. Improvements in learners' literacy skills in isiXhosa and English varied according to each milieu. While the teachers initially identified challenges to learners' reading and writing abilities, the analysis of learners' science notebooks suggested that they used writings to support their investigations. Some teachers cited difficulties with certain aspects of the model, such as problems with developing an investigable question and argumentation, yet overall, teachers found the strategy useful for developing learners' language skills, as well for strengthening their pedagogical practices in science. Teachers' gradual improvements in the use of the model suggest that they were able to use the scientific literacy strategy to support the cognitive and linguistic development of second-language learners.

UNDERGRADUATE STUDENTS' TRAINING TO ATTEND THE VISITORS OF THE PROGRAMS OF EXPLORATORY SCIENCE MUSEUM - UNICAMP: A SUCCESSFUL EXPERIENCE

Adriana Vitorino Rossi

UNICAMP, Museu Exploratório de Ciências, Director of Education

adriana@iqm.unicamp.br

Fabiana dos Santos Toledo

UNICAMP, Museu Exploratório de Ciências, Supervisor of Educative Sector

fabianadossantostoledo@gmail.com

ABSTRACT

The interaction of all aged people with science in non formal education spaces such as museums can be facilitated by mediation conducted by specially trained people. The Exploratory Science Museum - UNICAMP trains undergraduate students from every different courses to work as mediators in its two major programs focused on hard sciences. The rich contributions from all these different areas of expertise provide an interdisciplinary character that improves the public attendance. Since 2008, we have trained a group of c.a. 60 mediators from 26 courses. Evaluation data show the correctness of this proposal of mediators training and forming staff.

Keywords: *non formal education, undergraduate students' motivation, science for all.*

INTRODUCTION

The purpose of Exploratory Science Museum - UNICAMP is to promote the dissemination of the scientific culture, valuing the social life, the leisure and the accessibility, at an area which focuses on the formation processes of the science and the technology, its impact on daily life and the environmental developments. With this commitment, our mission is to be an area of education and public communication of science and technology as a social creation, approaching to contemporary and contextualized problems. (Firer et al, 2008). Currently we occupy a space of about 40,000 m² campus of Campinas, with a small administrative building and an exhibition area that is being revitalized from the structure of an old naked eye observatory.

The Museum was established institutionally before having a physical building in 2005 when the first 2 programs, "NanoAventura" and "Oficina Desafio" (see http://www.mc.unicamp.br) started to receive people. This was possible because these programs travelled between cities and schools. The "NanoAventura" is currently headquartered in the campus of Campinas and has a replica in the Catavento Cultural and Educational in Sao Paulo-SP (details on http://www.cataventocultural.org.br). The "Oficina Desafio" can still go to schools even in the other cities.

The interaction of the visitor public of museums with Science can be facilitated by mediation conducted by specially trained people. Although this service can be performed by professionals, our Museum has been invested in training undergraduate students to act as mediators or guides for the public reception in our programs. Different names such as educators, mediators, facilitators, guides, hosts, entertainers, among other can be cited. Our Museum has mediators (in Portuguese *mediadores* or *monitores*) as we are used to call the very important group of undergraduate students who interacts directly with the visiting public. Although this service can be performed by professionals, our Museum has been made efforts in training undergraduate students to act as mediators for the public reception in our programs.

For now, the theme of our major programs in operation ("NanoAventura" e "Oficina Desafio") is focused on hard science and since 2005 more than 40,000 people had visited them. Initially, the attendance programs to the public were mediated mainly by students of physics and with increasing the numbers of visitors it was necessary to expand the number of mediators and improve the new mediators training course.

METHODS

In 2007, we started to organize an intensive course for training new monitors: an intense but pleasant programme of one week work. The number of mediators aspirants has increased by over 200 % since 2007 and the courses of origin of these undergraduate students has also increased. Initially, the training was focused on conceptual and operational aspects of the programs and it has gradually been improved by introducing different approaches to interact. We decided to call people with the most different professional/personal profile and distinct skills including scientists, doctors, educators, nurses, blind, deaf and dumb people and their interpreters. All they are invited to specially called lectures and interactive talks. The mediators in training have been expressing good acceptance to these diversified contacts on spontaneous demonstrations and posterior comments at evaluation interviews. Another important role of activities is the implementation of various cooperative games in order to motivate the students to start interacting as a cohesive group. Intensive first aid training is also included. The five days of training are followed by the senior mediators who enhance the activities as examples for inspiration and background on various aspects discussed.

Despite of the focus of our programs in hard sciences, the training of the mediators is following on the opposite direction: we have chosen the diversity of origin courses of the mediators as an option to diversify the profile of our staff. The valuable contributions from each one of the different areas of expertise provide an interdisciplinary profile to our staff that improves the public attendance. The number of undergraduate students interested in working as mediators increased almost 200 % and the number of origin courses of these students increased from 11 in 2007 to 27 in 2010, despite of the remaining emphasis on hard sciences in our programs. Pedagogy and teaching degree students are less than 30% of the mediator staff.

RESULTS

The regular evaluation tools of the programs of the Museum have been used to evaluate this proposal of staff training. With regard to the public attendance, spontaneous demonstrations of opinion have been reported during the activities and there also are answers to evaluation inquiries, including teachers' and parents' when they are present. The performance of all students is very positive without distinction by area or course.

It may be noted that among the undergraduate students, working at the Museum as mediators is a considered as a very stimulating activity which arouses a new insight about sciences that is not common at their formal teaching/learning situations. All this involvement promotes effective interaction with the visiting public and represents a very important motivational factor regardless of the mediators' origin course.

CONCLUSIONS

All results show the correctness of this proposal for training the mediators, which must include affective involvement as an important motivational factor in promoting higher interaction between the public and the Science.

ABSTRACT

The Targeting Talent Programme aims to increase academic and non-academic preparedness of learners from socioeconomically disadvantaged backgrounds for admission and success at South African universities. Learners were selected from rural sites on the basis of nominations, biographical questionnaires and grade 9 promotion reports providing an avenue to access tertiary education.

Learners and their teachers were exposed to the university environment over a three year period (two week blocks) which included instruction in science, mathematics, personal skills development and mentor support.

This presentation addresses the success of the programme for allowing access to tertiary education and assessment of performance at university.

Keywords: *targeting talent; rural students; access to tertiary education; academic enrichment; opportunity.*

INTRODUCTION

The Targeting Talent Programme aimed to increase the academic, social and psychological preparation of academically talented learners through a four phase approach. The first phase involved conceptualisation and securing funding; the second identify the academically talented learners; the third phase undertook to design and implement academic enrichment, personal developmental skills residential; educator development and mathematics and science redress curricula. The current and fourth phase is to evaluate student acceptance at tertiary level and their academic performance in the first semester at university in 2010.

It is intended to present data indicating the number of admitted students and their initial academic success following our intervention. Students without such support have not gained admission to tertiary institutions or have performed poorly when admitted.

METHODS

The selection of youth with high potential to succeed academically therefore used a benchmark of achieving at least 65% in Mathematics, Science and English. To this, was added evidence of traits or behaviour patterns believed to correlate with academic success (as evidenced in the nomination form and the biographical questionnaire. Academically, learners with scores of 73% (average) in the three subjects were ultimately selected. In total 267 learners and 54 educators from the various schools were exposed to the programme. Following preparatory workshops with prospective participants, parents/guardians and educators held in the three provinces in May and June of 2007, 2008 and 2009 Participants were also exposed to various aspects of the University environment including residence. Initially learners and teachers were exposed to setting baseline parameters, an instructional phase that included specific instruction, including practical laboratory involvement and extracurricular activities. Learners and teachers were enlisted in a University residential academic enrichment, personal skills development and a mathematics and science redress curriculum. All learners had exposure to a mentoring programme whereby current university students participated as mentors and role models and were with their respective groups throughout the period.

RESULTS

Of 267 learners taking part in the programme,12 were unsuccessful at Grade 12 level but 219 (82%) achieved eligibility for admission to university and others were eligible for non-university studies; with a total of 163 students registered at university in 2010.

The programme increased learners' self-confidence and self-esteem, improved their performance in mathematics and science and provided them with the opportunity of realizing their potential and setting goals for the future.

CONCLUSION

The programme allows the university to address:

- geographic and socio-economic marginalisation (access to tertiary education in the South African context)
- access to and success in university for first generation South African talented students from lower socio economic backgrounds and under performing schools; one which culminates in graduation with a first degree in Science, Engineering, Health Sciences, Maths and Science Education
- the needs of under performing schools by contributing to teacher development

This programme counters negative school or community influences (lack of rigorous curriculum, poorly trained teachers, lack of role models) by providing the missing elements that help students aspire to, prepare for, and obtain acceptance at University. The programme has encouraged learners to become involved in their communities and to work in groups and as a team as well as gaining exposure to computers and science equipment that are not readily available at their schools.

THE CITIES COMENIUS PROJECT - CHEMISTRY AND INDUSTRY FOR TEACHERS IN EUROPEAN SCHOOLS

Raymond Wallace

School of Science & Technology Nottingham Trent University, UK

ray.wallace@ntu.ac.uk

Leo Gros

Hochschule Fresenius, Idstein, Germany

gros@hs-fresenius.de

ABSTRACT

THE CITIES COMENIUS PROJECT This project was an important Comenius project running from 2006-2009 and attracting over a quarter of a million Euros in funding from the European Commission. Its aim was to develop course modules which can be used by teachers in European schools to inform pupils in a positive and exciting way about what chemistry can achieve for them and society at large. One of its major outputs is a repository of resources available through its website at http://cities.eu.org/.

Keywords: *CITIES, Comenius, teaching materials, schools.*

INTRODUCTION

In many European countries, there is still an urgent need to interest more young people in studying chemistry. A Comenius funded European project, CITIES, Chemistry and Industry for Teachers in European Schools, which drew to a close at the end of 2009 set about developing teacher training modules which are designed to help teachers make their chemistry lessons more appealing to students by placing the subject in the context of their daily lives. Additionally through its website it has attempted to make students more engaged with chemistry by taking a diverse range of topics, many of which at first sight might appear to have nothing to do with chemistry, but which should attract their curiosity and presenting them in a lively manner. Thus information is to be found on, for example, fuel cells, liquid crystals, self-cleaning materials, condoms, packaging materials, food flavourings (Pringles), energy drinks, margarine, deodorants and antiperspirants alongside simple experiments which can be performed by students. Built around 4 modules, 'European context of chemical education, training and development', 'Commerce and innovation – our future', 'Chemistry changes everything', 'Chemistry – bringing it alive', the project also sought to inform teachers and pupils alike about the European context in which chemistry operates. Information therefore can also be discovered about European chemistry education, the European chemical industry, careers in chemistry and exciting or intriguing chemical science such as forensic investigations or the 'chemistry of a tin of ravioli' – all under one roof!

METHODS

The Comenius proposal was written and the partner consortium put together in Frankfurt in February 2006 and the project funded in the autumn of that year. The partners consisted of:
Contractor and Co-Coordinator: Europa Fachhochschule Fresenius (DE)
European Chemistry Employers' Group ECEG (BE)
European Mine, Chemical and Energy Workers' Federation EMCEF (BE)
Johann-Wolfgang-Goethe-Universität (DE)
Czech Chemical Society (CZ)
Gesellschaft Deutscher Chemiker (DE)
Institut Químic de Sarriá (ES)

Uniwersytet Jagielloński (PL)
Nottingham Trent University (UK)
Royal Society of Chemistry (UK)
Each partner has contributed in different ways to the project, some writing teaching materials, some trialing materials, others providing advice and support and so on.

RESULTS

CITIES products:

- Permanent website http://cities.eu.org, (accessible to both teachers and students & shortly to go fully live), with translated content in EN, PL, DE, CZ and ES, plus parts in TR, EE and PT
- CD-ROMs with learning/teaching material in EN, PL, DE, CZ, ES on request to CITIES national partner
- pdf versions of teaching/training material as downloadable files
- Handbook 'Chemical education in Europe' (EN, PL, CZ, DE, ES), with a multilingual glossary of key 'Euro-Chem' terms
- Help for teaching staff with training based on CITIES modules by national partners

Thus in the context of the modules described in the introduction, material can be found on the importance and scope of the chemical and related industries and what they do (Commerce and innovation – our future), a 'benefits landscape' of everyday uses of chemistry (Chemistry changes everything), experiments which relate to materials from everyday life (Chemistry – bringing it alive) and the employability of graduates in the global economy (European Context of chemical education, training & development). All this is designed to better inform teachers and their students about chemistry and help make it more relevant to their world.

Not only is there simple factual material but the consortium has also developed two in-service training courses for teachers, one in forensic science and one based around the chemistry of a tin of ravioli. The group has also produced a prototype 'Selling chemistry from a sample case' which is a model of a mobile experimental chemistry set with simple, safe experiments, plus Power Point presentations to relate everyday experience and chemistry.

CONCLUSIONS

Through this wealth of resources it is hoped that teachers and pupils alike with come to find chemistry a more meaningful and exciting experience.

MACROSCOPIC PHENOMENA AND MICROSCOPIC PARTICLES: STUDENTS' DISCUSSION ABOUT RELATIONSHIPS BETWEEN CENTRAL CONCEPTS IN CELL BIOLOGY

Anna-Karin Westman

Mid Sweden University

anna-karin.westman@miun.se

ABSTRACT

This study analyses students' discussions about cell biology concepts. Research has shown students to have difficulties in relating macroscopic phenomena with microscopic particles and molecules. An assignment was created which included concepts from these organization levels. The aim of the study was to analyse the discussions, with focus on how students expressed their understanding for relationships between the concepts. The discussions included utterances often posed as questions. Analyses showed that students had a mainly correct understanding of the biological content. A conclusion in the study is that students designed their concept map by asking each other questions about the concepts.

Keywords: *understanding of concepts, cell biology, organization levels*

INTRODUCTION

Research has shown that students have difficulties in relating molecular and microscopic particles with macroscopic phenomena (Bahar, Johnstone, & Hansell, 1999). A part of the scientific knowledge is to be able to make connections between the tangible, macroscopic phenomena and abstract, microscopic concepts. In this study student groups discuss relationships between concepts from different organization levels during a task that involved constructing a concept map.

BACKGROUND

In this study cellular respiration was chosen as subject area. Research has shown this to be a subject area with difficulties for students (Songer & Mintzes, 1994).

CENTRAL AIM

This study aims to investigate how students discuss relationships between cell biology concepts from different organization levels.

The three research questions are:

How do the students express their understandings of relationships between concepts from different organization levels during the construction of a concept map?

To what extent do the students demonstrate an understanding of the biological content?

How do the students make agreements?

METHOD

A list of concepts was presented in the program CMapTools (Novak & Cañas, 2008). The task for the student groups was then to form a map that showed relationships between the concepts. Student groups' discussions were analysed in three ways. The analyses included what type of talk students used in these parts of the discussions (Mercer, 1995), how they demonstrated their understanding of the biological content (Mork, 2005) and also how they made agreements.

RESULTS

The results showed discussions were students used a way of expressing their views as questions and mostly biological correct content (Figure 1).

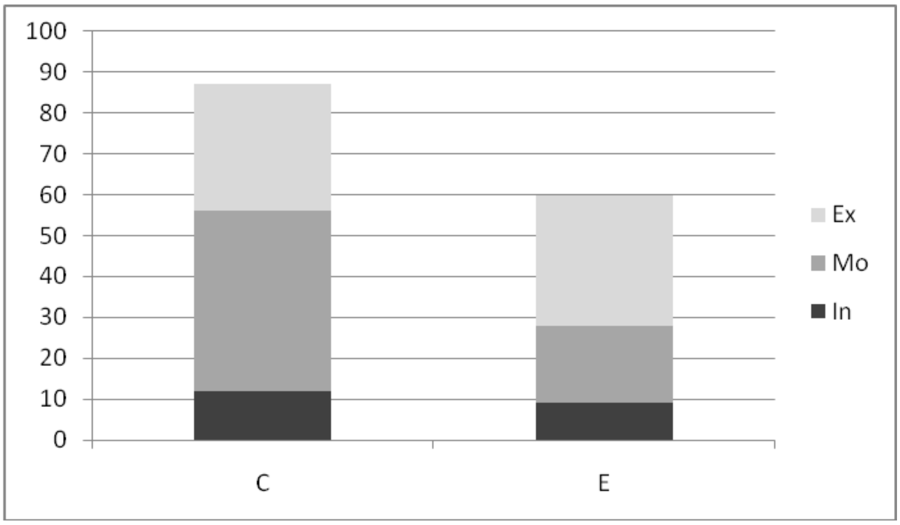

Figure 1 Categorisation of utterances. On the x-axis are the types of talk, C= Cumulative, E= Exploratory. The two categories are divided in to three levels of accuracy, In= incorrect, Mo= Moderate, Ex= expected (n=147).

The assignment made the students express their understandings of relationships between concepts from different organisation levels in cell biology. Agreements were made most often by a summation of the knowledge in the group. Questions replied by counter-questions were very common.

CONCLUSIONS

All individuals in the six groups had the common way of expressing their views as questions to the others. This can be interpreted as a sign of insecurity. On the other hand, analysis of the biological content in the discussions did not reveal any obvious misunderstandings of the included concepts. A minority of the utterances are incorrect. It is important to create learning situations that give students experience in “thinking at the cellular level” (Songer & Mintzes, 1994). In this study students discussed the concepts from different organization levels and their relationships with knowledge in many cases. An assessment of this kind may enhance understanding of a subject area.

Angelika.Wolf@ph-heidelberg.de

Matthias Laukenmann
University of Education
Heidelberg
Laukenmann@ph-heidelberg.de

ABSTRACT

The Self-Determination Theory of Motivation (SDT) presents one theoretical framework for Hentig's postulate (H. v. Hentig 2004) that learning requires independence individual responsibility and self-control of each learner.

This project tries to investigate the sustainability of this postulate. We are testing from three perspectives whether or not an observable connection between the degree of autonomy given and the students' subjective experience of social integration, autonomy and competence, exists. Therefore the study aims at investigating, whether the realization of those basic needs possibly lead to different levels of motivation and whether or not the degrees of self-determination, motivation and cognition are correlated.

Keywords: *Given Autonomy, Self-Determination, Motivation,*

Conceptual Change

INTRODUCTION

The study has two phases, sharing a common design.

The pilot study took place from March to June 2009. From October 2009 to April 2010, the main study takes place with 21 teachers and approximately 650 pupils of the eighth grade in the science lessons of secondary schools.

METHODS

The data collection investigates the degree of given autonomy, individual responsibility and self-determination offered to the learners. The data is collected from three perspectives (students, teachers and raters) with mainly standardised tests. Moreover, controlling variables, e.g. well-chosen areas of teacher's personality or students' beliefs are raised at the beginning. The factors experience of relatedness, of competence, of autonomy and motivational orientation are raised with the help of a standardised questionnaire at the beginning as well as at the end of the teaching unit. To measure the cognitive learning success (previous and specialized knowledge) two knowledge tests at the beginning and at the end of the series of lessons are conducted.

The evaluation of the data encompasses different analysis procedures. One the one way we make a quantitative analysis based on multivariate methods (covariance) analysis. Otherwise a path analysis and the development of multi-level effect model are intended.

RESULTS

The results of the pilot study showed mean correlations and high significances between the given autonomy (GA1/2) and the basic needs (Perceived Social Integration (PSI), the Perceived Support of Autonomy (PSA) and the Perceived Competence (PC) according to Deci and Ryan.

Furthermore the results demonstrated that there are mean correlations and high significances between the satisfaction of the basic needs and the different aspects of motivation, which confirm to the theory. That means for example, that a student, who doesn't perceive him-/herself as socially related, is with high probability amotivated and extrinsically motivated.

It is important to understand, that according to Deci and Ryan, all the three basic needs have to be satisfied in order for a student to have a high quality of motivation.

CONCLUSIONS

The main study will reexamine those trends and if possible verify them within a more representative population. The results will be presented.

ABSTRACT

A Chinese version of the international Relevance Of Science Education (ROSE) project was administered to a total of over 2,400 students in 70 classes of secondary schools in three Chinese cities, namely Hong Kong, Guangzhou and Shanghai. Apart from adopting the partial credit Rasch model for data analysis, exploratory factor analysis was applied to yield 24 key factors from this set of ROSE data. Finally, we shall make more in-depth discussion on a few selected topics in which there are either striking differences between students in Hong Kong and mainland China.

Keywords: *students' interest of science learning, Chinese learners, Rasch model*

INTRODUCTION

The study of student attitudes towards science or science learning has become a key component of science education in the past three to four decades. Apart from the validity and reliability of individual research instruments and methodologies, this vast body of attitudinal research (see, e.g. Gardner, 1975; Osborne, Simon, & Collins, 2003) has one major problem in common – the research instruments and methodologies have mainly been adopted by individual teams of researchers in specific contexts (and/or countries or regions). There is no easy way to undertake a comparative study directly from student responses as collected by different questionnaires or research instruments. Therefore, instead of developing a new instrument to collect Chinese student data on their interests, attitudes, views, and motivation in the affective domain of science education, we made a Chinese version of the international ROSE research instrument, of which the complete instrument and the proper procedures of administration have been fully documented in the research handbook by Schreiner & Sjøberg (2004). Our Chinese version includes a section for collecting its own set of socio-economic data and has undergone rigorous processes to ensure its validity and reliability.

RESEARCH METHODOLOGY AND FINDINGS

The partial credit Rasch model (see, e.g. Bond and Fox, 2007) was employed to carry out the quantitative analysis because it allows us to (a) find out the relative levels of endorseability for all of the items used in the questionnaire instrument and (b) make a more reliable comparison of student levels of agreeability (or interests/positive attitudes) with various sections of the questionnaire. The complete ROSE questionnaire contains 245 fixed response items in eight parts. As shown in Fig. 1, the Rasch analysis tells us that topics like "C10. Unsolved mysteries in outer space", and "C13. Why we dream while we are sleeping, and what the dreams may mean" are most interesting to those Chinese students while topics like "A17. Atoms and molecules", "A47. How petrol and diesel engines work", and "E1. Symmetries and patterns in leaves and flowers" are of least interest to them.

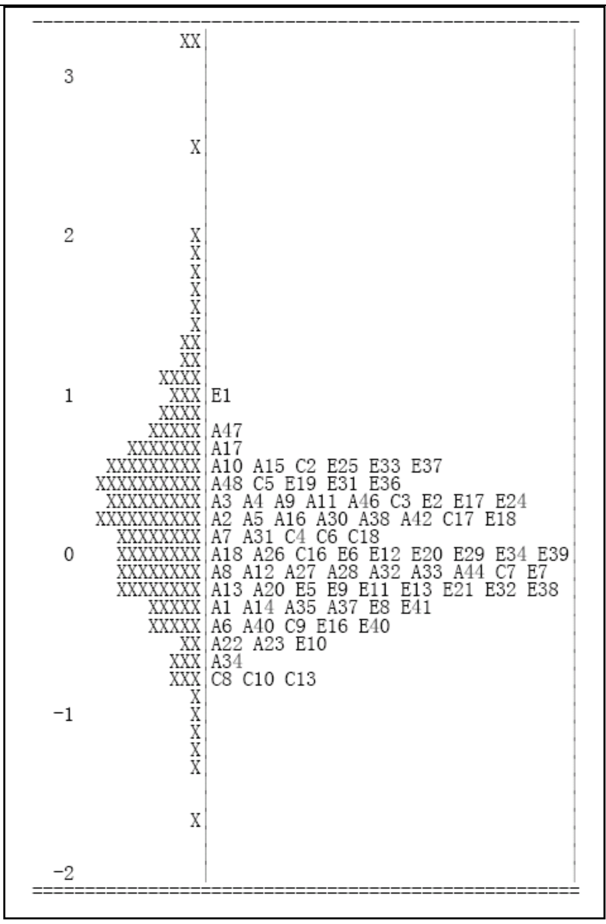

Figure 1: Map of latent distributions and response model parameter estimates as generated from the ConQuest software. The numbers in the left-most column are in logit scale which is a logarithmic transformation the odds of success (Bond and Fox, 2007). Each "X" in the distribution chart (LHS) represents 18.6 students who are having a certain level of interest in science learning. The labels on the RHS refer to the 81 science topics of the questions on "What I want to learn about – How interested are you in learning about the following?" in the ROSE instrument (Schreiner & Sjøberg, 2004). Their positions in the logit scale indicate the level of difficulty for the students to respond with interest in learning them, i.e. the lowest items like C8, C10 and C13 are most interesting to the students while the top items like E1, A47 and A17 are least interesting.

As we understand that the student affective domain of science learning is multidimensional in nature, we need to conduct an exploratory factor analysis to uncover various underlying constructs using the SPSS software. 24 key factors are yielded for this ROSE questionnaire and 11 of them are about what the students want to learn. Each factor (or category of science topics) contains 4 to 10 topics with the highest factor loading of 0.655 to 0.811. The overall alpha reliability for those 81 topics is 0.97. More detailed results on the quantitative comparison across the three cities between students' level of interest in various science topics vs gender, socioeconomic factors and banding of their schools will be presented in the full conference paper together with the qualitative results from the interview of students for providing plausible explanations on the similarity and differences on the students' interest of learning various science topics.

CONCLUSIONS

The ROSE instrument has been translated into Chinese for administration to around 2,400 students in 3 cities of China. Some quantitative analysis has been carried out using the

Rasch model of measurement and method of factor analysis, yielding a better understanding on the characteristics of the Chinese students on their views, interest and attitudes towards science learning.

ABSTRACT

International research has shown that fewer students are studying science and going onto science careers, with serious consequences for scientific understanding, literacy and national economies. Our research project links promoting and enhancing science education and communication, the “Gravity Discovery Centre” (GDC, a centre for school science enrichment), the “Graham (Polly) Farmer Foundation”, which provides education enrichment to indigenous disadvantaged students in remote schools, and a large new robotic Zadko telescope. This research will evaluate the effectiveness of science enrichment programs in changing school students’ attitudes towards science, career goals, and expectations as well as science understanding.

Keywords: *Science students’ enrolment, motivation, impact of science centres.*

INTRODUCTION

Students' Attitudes towards Science and Enrolment Decline: A Significant International Problem

This research focuses on understanding and improving high school students' attitudes towards science. Considerable evidence has accumulated to demonstrate that Australian and other countries' schools and universities are not producing enough scientists and engineers to sustain the scientific and economic development (DEST, 2006). Despite science and technology being key factors contributing to the economic growth and social prosperity in both advanced and developing nations, there is a worldwide phenomenon of declining student attitudes to science in developed nations (Sjoberg, 2005), including the UK (Office of Science and Technology and the Wellcome Trust, 2001), Europe (European Commission, 2007), the USA (National Academies Committee on Science, Engineering, and Public Policy, 2006) as well as Australia (DEST, 2006). Within Australia this phenomenon has been referred to as a crisis (Tytler, 2007) because it has resulted in "a decreasing proportion of students taking post-compulsory science; low levels of participation in tertiary courses in physics and chemistry and higher mathematics; [and] a shortage of graduates and research students in key areas" (Tytler & Symington, 2006, p. 40).

The problem of poor student attitudes towards science and falling enrolments in science subjects at the secondary and tertiary levels of education is of critical importance to the scientific and economic development of many countries. There are a number of indicators of the enormity of the problem. The most recent results from the Programme for International Student Assessment (PISA) conducted by the Organisation for Economic Cooperation and Development (OECD) showed that 15-year old Australian students showed very low interest in learning science. The Longitudinal Surveys of Australian Youth (Fullarton et al., 2003) show that between 1993 and 2001 national participation rates for Year 12 students in all science subject areas dropped (with the exception of psychology). In chemistry, for example, the participation rate dropped from 22.6% in 1993 to 17.8% in 2001. In addition to poor student attitudes towards science, falling achievement of Australian high school students in science is well documented and is making national headlines (Ferrari, 2008).

METHODS

This presentation will discuss different research methods evolving to evaluate three types of educational programs, all delivered through the Gravity Discovery Centre as follows:

Specialised Enrichment: Innovative high quality programs already developed and comparable to many enrichment programs offered by diverse facilities internationally. These activities include both pre-visit and post-visit classroom activities.
Motivating through Research: Students will use the Zadko telescope and interact with researchers. This aspect of the program will enable students to discover new astronomical objects and to provide improved data for known objects (asteroids, Near Earth Objects, gamma ray bursts and supernovae).
Learning through Narrative: Students will use the Cosmology Gallery facilities. Here we will focus on the story of the universe and compare cultural creation stories at the Gravity Discovery Centre with the scientific version. This unique facility is specifically designed for multi-cultural approaches to learning.

ABSTRACT

In this paper the objectives of education in views of Jaspers and the role of virtual education in them was studied. Jaspers believes that educating learners as useful members of community means, on one hand, preparing them for future life and job provided by virtual education and on the other hand, it means reviving and fostering traditions of that society to learners through day to day life, manner of speaking and social encountering like contact with human character of a teacher. Therefore, the virtual education can not be replaced face to face education. Finally some applied implications have been mentioned.

Keywords: *Virtual education, Information Technology, Social objectives of education, Jaspers*

INTRODUCTION

With attention to the importance of education and its role in the whole of human life and destiny, it is necessary alongside virtual education technical development, the role and its consequences on the whole education process and human life will be investigated.

Thoughts and questions about the technology date back to Greek, but by development of new technologies in the nineteenth century, and enveloping it in the twentieth century, philosophical questions of this technologies also has been spread and philosophers such as Heidegger(1977),for instance, less or more have evaluated technology and information technology and its consequences. Among the philosophers who have studied new Technologies the role of existence philosophers is more prominent and fundamental.

On the other hand, Jaspers (1956, 1957, 1963 and 1969), one of the main representatives of the philosophy of existence, have some ideas as educational philosopher. In the present study his ideas regarding the education and the relationship of virtual education with that are investigated. It seems that, on the one hand, education has a kind of communicational and social nature. On the other hand, Jaspers considers that "being self" and "becoming self" to be possible only on the basis of communication (1969). Therefore, social objectives of education can be investigated from the view points of Jaspers. Based on this fact, first some of the social objectives of education are deduced with regard to the Jaspers views and the role of virtual education in the achievement of these objectives are studied.

RESULTS

In the study the relationship between the virtual education and some of the social objectives of education were examined from the view of Jaspers.

Jaspers makes difference between "community" and "society" and believes that educating learners as useful members of community means, on the one hand, preparing them for future life, job and on the other hand, it means awakening, preserving and fostering the traditions and the genuine historical culture and soul of that community in students through day to day life, manner of speaking and social encountering like face to face contact with human character of teacher that Jaspers (Graic, 2000) calls "existential relation". He claims that "being self" and "becoming self" is possible only based on such communication; communication with others, traditions, culture and history. Jaspers in his emphasis on the role of communication in human evolution, even in the lowest level of life which is the ordinary life, refers to the deaf kids that were considered as dull before the creation of the sign language, but by the creation of the sign language as a communication device, the inaccuracy of the theory and the role and significance of communication were revealed (1963). Furthermore and Like Kierkegaard, (Prosser and Ward, 2000) it seems that we can introduce authentic person in relation to authentic community: authentic community knows its past and depends to it and so people have opportunity to conscious about the past of their community and connect to it.

Virtual education in connection with the first aspect, (preparing students for future life and job), has provided abundant opportunities: Nowadays, the easy and fast access to the information has, has moderated the extensive need for it and also has helped in saving the time for gathering information and so has accelerated the process of scientific production. As the consequence, the quality of the material life has increased. Every day the learners witness the achievements of Information Technology such as freeing human from illnesses and enriching his life with learning, art, sport, and recreation. As an example, we can mention the extensive virtual education that has facilitated the learning of such scientific skills as driving and piloting.

But alongside these achievements, virtual education also has changed the life pattern of teachers and students. For example, they rather communicate face to face, for their informational and even social needs, communicate virtually such as chat and email. Spreading the process is a challenge for the second aspect, i.e. awakening, preserving and fostering the traditions and the genuine historical soul of that community in students.

CONCLUSIONS

So the educational systems should train the teachers who are representative of traditions and authentic historical culture of that specific community. It should also provide the context for interactions between the teacher and learners in the school and community in order to animate the community's traditions and culture in the students and supply the ground for preserving and growing them.

on the foundation of research findings and by accepting the priority of the question concerning technological paradigm than question concerning how reforming by using it some applied implications as follow up virtual education beside face to face education and emphasis on holistic view than unilateral one in using virtual education have been mentioned in conclusion part of this paper..

POSSIBILITIES OF AUTHENTIC LEARNING OF CHEMISTRY (AND OTHER NATURAL SCIENCES) AT A HIGH SCHOOL
/
MOŽNOSTI AVTENTIČNEGA UČENJA KEMIJE (IN DRUGIH NARAVOSLOVNIH PREDMETOV) V GIMNAZIJI

Mojca Alif

I. gimnazija v Celju

Mojca.alif@guest.arnes.si

ABSTRACT

Research has shown that chemistry is not very well liked by high school students. We suppose the main reason for such a dislike of chemistry is the fact that students view it solely as relatively difficult theory. What they do not realise is its applicability in relation to life.

The best way to make students familiar with the practical side of chemistry is authentic learning. Therefore we introduced into chemistry lessons:

- research work
- project work
- excursions / field trips
- Natural Sciences Association

We have found that the intense application of various kinds of authentic learning within chemistry lessons raised students' interest in chemistry. Indicators: number of students choosing chemistry for the final examination (*matura*), students' success in competitions, number of research projects completed, choosing chemistry as a subject of further university study.

Keywords: *authentic learning, chemistry, research work, project work, excursions, scientific lectures*

UVOD

Raziskave izpred nekaj let (1, 2) so pokazale, da kemija med dijaki ni priljubljena. Eden glavnih vzrokov za to je dejstvo, da jo dijaki dojemajo le kot relativno zahtevno teorijo, ne vidijo pa njene uporabnosti in povezanosti z življenjem. Zato je najboljši način za povečanje priljubljenosti kemije, dijakom osmisliti kemijsko teorijo in jo povezati z življenjem.

METODA

Da bi povečali priljubljenost kemije med dijaki naše gimnazije in v njih vzbudili za naravoslovje nasploh, smo poskusili profesorji z različnimi novimi didaktičnimi in metodičnimi elementi spremeniti pouk kemije. Eden od teh elementov je avtentično učenje.

Na naši šoli smo uvedli naslednje oblike avtentičnega učenja:

- raziskovalno delo
- projektne dneve
- ekskurzije
- Naravoslovno društvo

Raziskovalno delo

Raziskovalne naloge s področja kemije opravljajo dijaki večinoma v povezavi z lokalno industrijo in laboratoriji. Za raziskovalne teme poskušamo izbrati čim bolj avtentične probleme. V eni od nalog smo v sodelovanju s tovarno Emo raziskali odpornost različnih vrst protikorozijske zaščite, v drugi z metodo obarjalne titracije določali količino natrijevega klorida (soli) v priljubljenih prigrizkih, v sodelovanju z Inštitutom za hmeljarstvo in pivovarstvo določali vsebnost telesu koristnih kovin v pivu, več raziskav pa smo opravili tudi v sodelovanju s Cinkarno.

Pri tem delu dijaki razvijajo raziskovalne kompetence in kar je morda še pomembneje, spoznajo praktično uporabo šolske teorije.

Projektni dnevi

Projektni dnevi omogočajo zelo učinkovito povezavo kemijske teorije s prakso. Primer projektnega dneva, ki smo ga izvedli letos: Analiza živil

Dijaki so, razdeljeni v pare ali trojice, analizirali živila. Določali so količino nitratov v zelenjavi, koncentracijo nitratov v vzorcih pitne vode, koncentracijo ocetne kisline v različnih vrstah kisa, koncentracijo sladkorja v sadnih sokovih in trdoto vode. Pri tem so se seznanili z različnimi eksperimentalnimi tehnikami (titracijo, ekstrakcijo, uporabo refraktometra, tehtanjem, uporabo indikatorskih lističev…), pa tudi s teorijo (škodljivost nitratov, trdota vode, nevtralizacijska titracija, kemijsko računanje…)

Ekskurzije

Uspešna in med dijaki zelo priljubljena oblika avtentičnega učenja so ekskurzije. Izvajamo jih tako v lokalnem okolju, kjer dijaki spoznavajo industrijske kemijske laboratorije, proizvodnjo v kemijskih tovarnah, ekološke službe tovarn (Cinkarna, Emo, Etol, Aero…) kot širše po Sloveniji (obisk Inštituta Jožef Stefan, inštitutov na Medicinski fakulteti, Kemijskega inštituta…) in Evropi (Tehnični muzej v Münchenu, Naravoslovni muzej na Dunaju, rudniki soli pri Salzburgu…).

Naravoslovno društvo

Najzanimivejša oblika avtentičnega učenja kemije na naši gimnaziji, morda celo edinstvena v Sloveniji, je Naravoslovno društvo. Ustanovljeno je bilo v začetku leta 2007 na pobudo peščice dijakov, ki jih je zanimalo naravoslovje. V okviru naravoslovnega društva vsak mesec organiziramo aktualna predavanja uglednih slovenskih znanstvenikov z različnih področij naravoslovja. V zadnjem času so se lahko dijaki seznanili z naslednjimi kemijskimi temami: nanodelci (uporaba, toksičnost), uporaba matematičnih metod pri razvozlavanju kemijskih struktur, kemijski mehanizmi odvisnosti, kemijske prilagoditve organizmov na življenje v ekstremnih okoljih, biokemija gripe (o virusih in cepivih proti gripi)…Na teh predavanjih dijaki spoznajo različna področja znanosti, kjer je mogoče uporabiti znanje kemije, spoznajo najaktualnejša naravoslovna znanstvena vprašanja in tesno medsebojno povezanost različnih naravoslovnih področij.

Poleg predavanj, ki jih mesečno organiziramo na šoli, pa društvo skrbi za popularizacijo naravoslovja tudi s tem, da dijakom predstavljamo različne študije in poklice v naravoslovju.

REZULTATI

Na šoli ugotavljamo, da se je s spremenjenim načinom poučevanja kemije spremenil tudi odnos

dijakov do tega predmeta. Kot dokaz za to štejemo:

- povečanje števila dijakov, ki opravljajo maturo iz kemije
- povečanje števila in kvalitete dosežkov naših dijakov na državnem tekmovanju iz kemije, pogosto uvrstitev na mednarodno kemijsko olimpijado in evropsko olimpijado iz naravoslovja
- povečanje števila dijakov, ki se odločijo za študij kemije, biokemije, farmacije
- in nenazadnje: z avtentičnim učenjem vzbudimo zanimanje za kemijo tudi pri tistih dijakih, ki jih teorija kemije ne zanima.

ZAKLJUČEK

Rezultati analiz kažejo, da kemija med dijaki ni priljubljena. Eden od vzrokov za to je dejstvo, da dijaki zaznavajo kemijo le kot relativno zahtevno teorijo, ne poznajo pa raznotere možne uporabe te teorije v industriji, medicini in drugih področjih človekove dejavnosti. Prav zato smo prišli na idejo, da bi bilo mogoče priljubljenost kemije povečati s tem, da dijakom čim nazorneje predstavimo povezanost šolske kemijske teorije s prakso.

Z različnimi oblikami avtentičnega učenja (raziskovalno delo, projektni dnevi, tematske ekskurzije in aktivnosti Naravoslovnega društva) nam je to uspelo. Posebej zanimiva in edinstvena oblika avtentičnega učenja, ki jo (vsaj kot je nam znano) izvajamo samo na naši gimnaziji, so predavanja priznanih znanstvenikov, ki dijake seznanjajo z aktualnimi naravoslovnimi temami.

Da je kemija postala med dijaki bolj priljubljena, dokazuje povečanje števila dijakov, ki izberejo kemijo za maturo, večja uspešnost naših dijakov na državnem tekmovanju iz kemije in redno uvrščanje v ekipo za mednarodno kemijsko olimpijado ter znatno povečanje števila dijakov, ki se odločijo za študij kemije, biokemije, farmacije in drugih ved, povezanih s kemijo.

ABSTRACT

Slovenia participated in major international studies in science education, namely TIMSS – Trends in International mathematics and Science Study and PISA – Programme for International Student Assessment. The last data collections on student science achievement conducted in Slovenia were PISA 2006 and TIMSS 2007. This paper presents science, chemistry achievement of Slovene students in comparison with other countries in both mentioned international studies. Slovene chemistry achievements on international level are relatively high and regularly higher than achievements in other science subjects.

Keywords: *international studies, PISA, TIMSS, science, chemistry achievement*

UVOD

V analizi kemijskih dosežkih slovenskih učencev v mednarodnem merilu upoštevamo dve odmevni mednarodni raziskavi na področju naravoslovja: TIMSS (Trends in International Mathematics and Science Study) in PISA (Programme for International Student Assesment). Zadnji mednarodni podatki o kemijskih dosežkih s katerimi razpolagamo so iz raziskave TIMSS 2007 in iz merjenja naravoslovne pismenosti PISA 2006. V prispevku želimo analizirati dosežke slovenskih učencev na področju kemije, v primerjavi z mednarodnimi dosežki iz obeh omenjenih raziskav.

METODA

Analiza kemijskih dosežkov slovenskih učencev v mednarodnih raziskavah TIMSS 2007 in PISA 2006 je temeljila na poglobljeni sekundarni analizi dosežkov slovenskih učencev v primerjavi z mednarodnimi dosežki učencev, objavljenimi v mednarodnih in nacionalnih poročilih.

REZULTATI

Ko analiziramo dosežke iz naravoslovnih predmetov slovenskih učencev v raziskavi **TIMSS 2007**, ugotavljamo, da so relativno visoki, saj so statistično pomembno višji od povprečja mednarodne lestvice (500 točk). Če pogledamo dosežke na skupini nalog, ki iz mednarodne opredelitve pokrivajo področje kemije je razvidno, da slovenski učenci na kemijskih nalogah izkazujejo zelo visoke dosežke. Iz poročila o raziskavi TIMSS 2007 ugotovimo, da dosežki slovenskih učencev na področju biologije (8. mesto od 49) in fizike (9. mesto od 49) zaostajajo za kemijskimi (4. mesto od 49), a so vsi nadpovprečni. Prav tako lahko iz podatkov (rezultatov) raziskave zaključimo, da so dosežki in napredki naših učencev v naravoslovju večji kot v matematiki. Ker so v raziskavi TIMSS naloge razdeljene po vsebinskih področjih naravoslovja: kemija, biologija, fizika in geografija, je analiza in primerjava dosežkov po predmetnih področjih lažja kot v raziskavi PISA, vendar ob natančnejši analizi objavljenih nalog raziskave TIMSS 2007 in njihovi razvrstitvi na posamezna naravoslovna področja ugotavljamo, da je kar nekaj vsebin opredeljenih v raziskavi kot fizikalnih zastopanih tudi v kemijskem kurikulu in obratno, na kar velja biti pozoren pri sami analizi nalog. Število kemijskih nalog v raziskavi TIMSS 2007 je bilo 41. Pri primerjavi načrtovanih odstotkov časa v preizkusih za posamezna vsebinska naravoslovna področja za osmošolce ugotavljamo, da je največji delež namenjen biologiji (35 %), potem sledi fizika (25%) ter kemija in vede o Zemlji (s po 20%). Za lažjo orientacijo med nalogami so le te v raziskavi dodatno razdeljene v tri kognitivna področja: znanje (poznavanje dejstev, postopkov in pojmov), uporaba (uporaba znanja in razumevanja konceptov) in sklepanja (sklepaje in utemeljevanje). V analizi kemijskih nalog po teh treh področjih, lahko ugotovimo, da je na področju kemijskega znanja Slovenija z nalogama, kjer učenec prepozna da je kisik plin potreben za izgorevanje in kjer mora učenec prepoznati formulo za ogljikov dioksid (93,6 % pravilnih odgovorov) uvrščena na šesto in sedmo mesto med vsemi sodelujočimi državami, na petnajstem mestu po odstotkih pravilnih odgovorov pa je naloga prepoznavanja snovi, ki dobro prevaja toploto in elektriko. Slovenski učenci dobro prepoznajo vinski kis kot kislino (75,3 % pravilnih odgovorov), iz opisa spoznavajo spremembo barve indikatorja pri nevtralizaciji (66,3 % pravilnih odgovorov). Pri zapisu dveh spremembi, ki jih lahko opazimo med kemijsko reakcijo, jih je 40% znalo zapisati le eno in 31,1 % (pravilno) dve spremembi. Na področju kemije in uporabe Slovenija v primerjavi z ostalimi sodelujočimi državami uvrščena visoko. Slovenski učenci dobro obvladajo pogoje za rjavenje. Da sta za rjavenje potrebna voda in kisik iz zraka je pravilno odgovorilo 84,2 % učencev. Prav tako slovenski učenci dobro prepoznavajo katera raztopina je bolj razredčena in pojasnijo svojo odločitev (76,3% pravilnih odgovorov, pri čemer je zanimiva in vprašljiva razlika med deležem pravilnih odgovorov pri dekletih (82,1 %) in fantih (70,4 %)). Pri nalogi, ki preverja kaj povzroči, da se balon napihne, ko se soda bikarbona in kis pomešata je delež vseh pravilnih dogovor 42,9 % in je med dekleti (36,0 %) in fanti (49,9%) obratna slika. Pri tej nalogi je pomembno še to, da jih je od omenjenih 42,9% učencev s pravilnim odgovorom, le slabih 10% vedelo, da pri reakciji nastane ogljikov dioksid, 17,2 % da nastane plin in 15,8 % da poteče kemijska reakcija, kar je relativno primerljivo z mednarodnim povprečjem. Razlaga, da je kemijska sprememba v mleku povzročila spremembo lakmusovega papirja je vedela večina naših učencev, a le 37,1 % jih je to znala pojasniti (pravilni odgovor). Zakaj kocka ledu ostane zmrznjena dlje časa v lesenem, kot kovinskem zaboju je pravilno sklepalo le 17,6% učencev. Na področju kemije in sklepanja so slovenski učenci v primerjavi z ostalimi pokazali slabše znanje pri nalogah o gostoti snovi, prostornini verižice (le 19,1 % pravilnih odgovorov) in s tem določanje prostornine nepravilnim telesom. Branje tabel slovenskim učencem ne povzroča večjih težav (72,0 % pravilnih odgovorov). Nekoliko več težav je pri interpretaciji podatkov iz tabel. Le 23,2, % slovenskih učencev je za primere ločevanje zmesi znalo pojasniti »korake« oz. razloge ločevanja.

Pri raziskavi **PISA 2006**, ki je konceptualno precej različna od raziskave TIMSS, je sestava pisnih preizkusov glede na vsebino (kategorije znanja) razdeljena na naravoslovno znanje (fizikalni sistemi, živi sistemi, sistemi Zemlje in vesolje,tehnološki sistemi), kar je pokrilo cca. 60 % nalog in na znanje o naravoslovni znanosti (znanstveno raziskovanje, znanstvene razlage) zajeto v cca. 40% nalog. Kemijske vsebine so bile v raziskavi PISA vključene v fizikalne sisteme in obsegajo zgradbo snovi, lastnosti snovi, kemijske spremembe snovi, energijo in njene pretvorbe ter kemijsko reakcijo. Med objavljenimi nalogami raziskave PISA 2006 na kemijsko področje segajo naslednje naloge: Zaščita pred soncem, Oblačila, Kisli dež in Učinek tople grede. Če primerjamo dosežkov slovenskih učencev na nalogah iz sklopa fizikalni sistemi z drugimi državami ugotovimo, da so dosežki slovenskih učencev relativno visoki. Pri primerjavi dosežkov slovenskih učencev med sklopoma Fizikalni sistemi in Živi sistemi, ugotovimo, da smo se bolje odrezali pri Fizikalnih sistemi, kamor spadajo tudi kemijske vsebine. Pri tem pa je treba opozoriti, da število nalog v posameznih področjih ni enakomerno in je sklop Živi sistemi veliko bolj zastopan z nalogami v preizkusu znanja kot sklop Fizikalni sistemi. Posplošljivost rezultatov na manjših sklopih nalog je sicer šibkejša kot na večjih sklopih, kljub temu pa iz rezultatov lahko izluščimo zgornjo ugotovitev. Primerjava lestvice skupnih naravoslovnih dosežkov z lestvico dosežkov na področju fizikalni sistemi pokaže napredek Slovenije, ob tem pa imajo največji napredek še Madžarska, Češka in Slovaška, kar morda nakazuje poudarke v njihovem (in našem) poučevanju naravoslovja. Na lestvici dosežkov iz znanja o naravoslovnih znanosti PISA 2006 so dosežki slovenskih učencev relativno nižji kot v primeru sklopa Fizikalni sistemi ali če rečemo drugače: v mednarodnem merilu so slovenski učenci uspešnejši v znanjih iz Fizikalnih sistemov kot v znanjih o naravoslovnih znanostih. Eden od možnih vzrokov za to je lahko večja povezanost vsebin nalog Fizikalnih sistemov s kurikulom. Zanimivo je tudi to, da podoben kontrast med temi dosežki lahko opazimo tudi za Češko, Madžarsko in Slovaško in ga lahko dobro ilustriramo z analizo posameznih vprašanj »kemijskih« nalog, npr. Kisli dež (2. vpr. (znanje naravoslovja): Slovenija - 57,6 % pravilnih odgovorov (povprečje OECD: 57,7 %) in 5. vpr. (znanje o naravoslovnih znanostih): Slovenija - 15,6 % pravilnih odgovorov (delno pravilnih odgovorov 42,4 %) povprečje OECD - 35,6 %.

ZAKLJUČEK

Zadnji mednarodni podatki o kemijskih dosežkih slovenskih učencev s katerimi razpolagamo so iz raziskave TIMSS 2007 in iz merjenja naravoslovne pismenosti PISA 2006. Raziskavi se po konceptualni zasnovi znanja kemijskega področja (in pri drugih metodoloških elementih merjenja znanja) med seboj precej razlikujeta, kar pa lahko izkoristimo za širšo in bolj poglobljeno sliko o znanju slovenskih učencev. Splošna ugotovitev, ki jo prepoznamo v obeh raziskavah, je, da so kemijski dosežki slovenskih učencev v mednarodnem merilu visoki in hkrati praviloma višji od dosežkov na drugih naravoslovnih področjih. Pri tem pa ni povsem nepomembno dejstvo, da so kemijske vsebine v obeh raziskavah (posebej PISA) zastopano z relativno majhnim deležem nalog. Prav tako mednarodna klasifikacija, razvrstitev v vsebinska področja, ne sovpada povsem z slovenskim kurikulom kemije. Ugotavljamo, da ne moremo določiti dosežkov pri posameznih nalogah kot dobre ali slabe znotraj posameznega področja klasifikacij posamezne raziskave, temveč se je potrebno posvetiti nalogam samim in pogledati katere so tiste naloge oz. znanja, kjer slovenske učenke in učenci dosegajo visoke dosežke oz. obratno. In nekaj takih je predstavljenih v tem prispevku.

jurij.bajc@pef.uni-lj.si

ABSTRACT

Reading literacy among youth in Slovenia is an endangered species. These problems do not seem to be present in physics or other natural sciences, but this is unfortunately so mostly because the teacher's are adapting to decreasing literacy. In the paper a few examples from school practice and national assessment tests are used to demonstrate the necessity of the continuous development of reading competence at all school levels, because it is one of the key competences and it is crucial for lifelong learning.

Everyday problems cannot be divided into mathematical, linguistic, nature or social scientific, as there is a bit of all these ingredients in each of them. It is therefore crucial to prepare the pupils for real complex problems and not to feed them with oversimplified "school examples" alone. At physics class the teachers do not dare to post realistic problems with substantial text, as we are suppose to assess or grade the knowledge of physics and not of mother tongue. The pupils learn to strictly distinguish the subjects among themselves and the teachers follow with even simpler wordings and oversimplified examples, such as "The force *F* acts on a body." In this from bad to worse circle, not only are the pupils less interested in natural sciences or mathematics or physics, but their reading literacy is getting worse as well. Therefore, the only way out is to demand more from those who are capable to learn, to interconnect subjects, and to find new ways of showing the power of global knowledge. Those who learn harder need to be encouraged, but no further lowering of minimal demanded knowledge is acceptable, because this does not do the pupils any good in long term.

Keywords: *Reading literacy, physics, knowledge assessment*

UVOD

V Sloveniji in v svetu je v zadnjih letih opaziti zmanjševanje znanja po končanem pred univerzitetnem izobraževanju, kar je sledi tudi iz trendov mednarodnih raziskav, na primer PISA ali TIMSS. Šolske reforme pri nas so po drugi strani vse bolj naravnane v učencem prijazno šolo. Z rezultati oziroma posledicami teh sprememb v šolskem sistemu in v odnosu do znanja na sploh ne moremo biti zadovoljni. Namesto, da bi se zaradi prijetnejšega vzdušja učenci lažje in bolje učili, je opaziti porast težav, ki jih je bilo prej malo. Otroci tudi v višjih razredih osnovne šole čedalje slabše obvladajo tako osnovne matematične operacije –

na primer, odštevanje ali deljenje – kot osnovna slovnična pravila – denimo, uporaba velike začetnice ali postavljanje vejic. Posledica obojega je, da težko sledijo pouku pri naravoslovnih predmetih, posebej fiziki. Bralna pismenost je poseben problem, ker se tako učenci kot starši hitro odločijo, da pri pouku matematike, fizike ali kemije obsežnejša besedila nimajo mesta, ker da ti predmeti niso slovenščina. Tako si pri fiziki ne upamo postavljati realnih problemov z veliko besedila, saj preverjamo ali ocenjujemo znanje fizike in ne znanje jezika.

Primeri v prispevku naj ilustrirajo resnost stanja in naj nas spodbudijo k prenehanju prilagajanja ne-delu učencev.

PRIMERI

Prvi primer – definicija sestavljene količine

V osnovni šoli se pri fiziki srečamo že v osmem razredu z dvema sestavljenima količinama, ki ju učitelji označujejo kot zahtevni. To sta gostota in tlak. Posredno se z obema količinama otroci srečajo že v nižjih razredih devetletne osnovne šole, pri naravoslovju v 6. in 7. ter pri naravoslovju in tehniki v 4. in 5. razredu.

Ob vpeljavi gostote je učitelj zapisal enačbo $\rho = m/V$ in ob tem otrokom narekoval: "Gostota je sorazmerna z maso in obratno sorazmerna s prostornino.". Ob enačbi bi lahko, denimo, dejal tudi kaj takega: "Gostota nam pove, kolikšno maso ima enota prostornine neke snovi." Kaj od tega je bolj prav? Otroci so vsaj v osnovni šoli velikokrat zgolj prepisovalci, ki se o vsebini med poukom ne sprašujejo kaj dosti, doma pa se učijo raje po zapiskih kot po učbenikih. In zato ne opazijo razlike med obema izjavama. Videč le enačbo ta tudi obe videti ne napačni. Pa vendarle je pomembna razlika. Če ob vpeljavi povemo več, če učence, na primer, opozorimo na to, da je gostota lastnost neke snovi, na primer sladkorja ali železa, potem bodo hitro videli, da je druga izjava vsebinsko bolj ustrezna kot prva, saj je v izjavi sami implicitno vsebovano to, da je gostota lastnost snovi in ne, recimo, posameznega predmeta iz te snovi. Nasprotno pa prva izjava učenca navaja na misel, da bo gostota večja, če bomo povečali maso telesa, da se torej razlikuje od telesa do telesa iz iste snovi in ne opisuje snovi kot take.

S tlakom je podobno. Definicijska enačba se glasi $p = F/S$, kar lahko podobno kot prej interpretiramo ali kot "Tlak je sorazmeren sili in obratno sorazmeren ploščini ploskve." ali pa kot "Tlak nam pove, kolikšna sila deluje na enoto površine neke ploskve.". V tem primeru med izjavama ni velike vsebinske razlike, ker tlak za razliko od gostote ne opisuje lastnosti snovi, ampak je tako imenovana zunanja (eksterna) količina. Sile na telo se spreminjajo in v tem smislu ima prva izjava, da je tlak sorazmeren s silo, oprijemljiv fizikalni pomen. Če bomo na neko ploskev delovali z večjo silo, bo tlak tam večji. Podobno bo tlak pod ozko visoko peto damskega čevlja večji kot pod udobnim športnim copatom, ker je ploščina podplata na visoki peti mnogo manjša od ploščine pete športnega copata, teža pa v vsakem primeru približno enaka. Tudi druga izjava je smiselna, saj besedilno definira količino tlak kot kvocient med silo in ploskvijo.

Ob primernih zgledih iz vsakdanjega življenja bi morali otrokom že v nižjih razredih približati zveze med količinami, ki jih v višjih razredih spoznavajo v obliki enačb, po drugi strani pa bi še bolj nujno morali pri naravoslovnih predmetih, kot sta predvsem fizika in kemija, učenci enačbe ponotranjiti tudi v besedilni obliki. Za doseganje funkcionalne pismenosti bi morali in je po mojem mnenju tudi mogoče že v osnovni šoli doseči, da bi učenci abstrahirali do te mere, da bi znali povedano relacijo pretopiti v matematično relacijo oziroma enačbo in zapisano enačbo pomensko prebrati kot smiselno poved. To nikakor ni domena materinega jezika ampak nujni element naravoslovnih predmetov.

Drugi primer – besedilni fizikalni nalogi iz nacionalnih preverjanj znanja

Ob sestavljanju nalog iz fizike za nacionalno preverjanje znanja se ves čas srečujemo s problemom, koliko sme besedilo naloge biti opis realnega problema iz vsakdanjega življenja in koliko mora biti besedilo oblikovano kot "šolski primer" naloge. To drugo nam seveda bolje definira težavnost in preverjane cilje, omogoča bolj objektivno vrednotenje in s tem uporabnost nacionalnega preverjanja kot merilnega instrumenta. Po drugi strani so naloge v preizkusih dostikrat zgled učiteljem za oblikovanje nalog pri rednem delu z učenci. V duhu krepitve bralne pismenosti bi bilo potem smiselno nalogo oblikovati bolj "življenjsko" tudi za ceno malo daljšega besedila.

Prvi primer je po mnenju komisije relativno preprosta naloga, za katero je komisija tudi dobro vnaprej napovedala težavnost, saj je napovedi 0,50 (50 % učencev naj bi nalogo rešilo) sledila izmerjena težavnost 0,54 (Slika 1).

Naloga 11

V električni krog z generatorjem sta zaporedno vezani enaki žarnici. Skozi prvo se pretoči naboj 150 As. Kolikšen naboj se pretoči skozi generator v enakem času?

Obkroži črko pred pravilnim odgovorom.

A Skozi generator se ne pretoči nič naboja.

B Skozi generator se pretoči 150 As.

C Skozi generator se pretoči 300 As.

D Skozi generator se pretoči 450 As.

Slika 1: Primer naloge iz preizkusa rednega roka v šolskem letu 2006/2007.

Kljub temu, da je komisija dobro napovedala, da bo nalogo rešila okoli polovica učencev, ni povsem jasno, zakaj pravilnih rešitev ni več. Ker predmetna komisija za fiziko pri vrednotenju od učiteljev zahteva, da beležijo pri vprašanjih izbirnega tipa tudi nepravilne odgovore, lahko to vsaj špekulativno pojasnimo. Videti je, da sta razlagi dve, ali veliko učencev res ne razume oziroma ne prepozna zakona o ohranitvi električnega naboja, ali pa veliko učencev meša vzporedno in vzporedno vezavo. V tem primeru je ključna besedica v besedilu naloge "zaporedno", ker opisuje vrsto vezave dveh upornikov in generatorja. Besedilo je v ostalem delu jasno in lahko razumljivo.

Tabela 1: Število posameznih izbranih odgovorov pri primeru iz preizkusa rednega roka v šolskem letu 2006/2007. Izbira '0' pomeni, da učenec ni izbral nobenega odgovora.

Odgovor	A	B	C	D	0
Št. učencev	332	2458	1601	61	91

Na podlagi frekvence posameznih odgovorov (Tabela 1) je precej bolj verjetno, da so učenci zamenjali ali slabo prebrali besedilo in namesto za zaporedno razmišljali o rešitvi za vzporedno vezavo, saj so tak odgovor (B) izbrali 1,5 krat bolj pogosto kot pravilni odgovor (C), poleg tega je pogostost ostalih dveh napačnih odgovorov (A, D) ali izbira nobenega od odgovorov (0) zelo majhna, skupaj manj kot 11 %. Samo na podlagi analize odgovorov ne vemo, koliko izmerjeni rezultat odseva nepoznavanje fizikalne razlike med zaporedno in vzporedno vezavo, koliko pa je bilo napak zaradi površnega branja. V vsakem primeru je tako eno kot drugo direktno povezano z razumevanjem besedila, saj je tudi fizikalno razlikovanje med "*vzporedno*" in "*zaporedno*" vezavo pravzaprav le razumevanje obeh besed. Nalogo je uspešno, kar pomeni več kot v okoli 2/3 primerov, rešilo le 10 % najbolj uspešnih učencev. Za približno toliko učencev bi torej lahko rekli, da nimajo težav z razumevanjem pisanega besedila.

Drugi primer je naloga iz preizkusa v šolskem letu 2007/2008 (slika 2). Nalogo so učenci reševali po pričakovanjih, v celotni populaciji jo je rešilo 44 % učencev, komisija pa je pričakovala uspešnost okoli 40 %. Učitelji so komisiji v povratni informaciji na srečanju v Koloseju 2. oktobra 2008 in ob drugih srečanjih sporočili, da je imela naloga preveč besedila in da je to eden od razlogov za manjšo uspešnost. Tudi v tem primeru je nalogo uspešno rešilo le 10 % najbolj uspešnih učencev.

Naloga 7

Po zelo dolgem ravnem asfaltiranem klancu začne drseti velik kos snega z maso 100 kg. Med gibanjem je hitrost sneženega kosa stalna. Zaradi trenja se ves čas od kosa kruši po malo snega, del snega pod kosom pa se med drsenjem tudi tali, tako da je masa sneženega kosa ob vznožju za 5 kg manjša.

Katera od spodnjih izjav pravilno opisuje dogajanje med enakomernim drsenjem sneženega kosa?

Obkroži črko pred pravilnim odgovorom.

A Kinetična energija kosa se veča, ker se notranja energija kosa

Slika 2: Primer naloge iz preizkusa rednega roka v šolskem letu 2007/2008.

ZAKLJUČEK

V želji po boljšem sprejetju fizike ali drugih naravoslovnih predmetov se učitelji vse bolj prilagajamo slabšemu znanju učencev. Slabše znanje verjetno ni znak vse manjše sposobnosti učencev, temveč prej njihove vse manjše odgovornosti in pripravljenosti za resno šolsko delo. Učitelji pripravljamo poenostavljene naloge in primere, ki so suhoparni in jih učenci ne znajo povezati z vsakodnevnimi izkušnjami, zato fizike ne marajo, je ne razumejo in ne prepoznajo koristnosti naravoslovja. Namesto, da bi primere približali realnim situacijam in jih naredili zanimive, učitelji ponujamo še elementarnejše zglede, ki naj bi jih nezainteresirani poslušalci le nekako razumeli. Pri tem upamo, da bodo sčasoma spoznali, da je naravoslovno znanje še kako koristno. Učenci nikakor niso neumni in v zadnjih letih so se predvsem dobro naučili, da manj ko se trudijo, bolj smo tolerantni in manj zahtevamo. Na žalost učencev ne moremo ničesar naučiti učitelji, če se sami ne potrudijo in ne naučijo sami sebe. Zato je nujno pri pouku malo zmanjšati prijaznost in malo zvišati zahtevnost, če le iskreno želimo koristiti otrokom.

Z nekaj primeri smo nakazali, kako zaskrbljujoče je obstoječe stanje in kako nujno je od učencev v višjih razredih osnovne šole ali v gimnaziji pričakovati, da tisto, kar naj bi se naučili v predhodnem šolanju, tudi zares znajo. Bralno pismenost je nujno razvijati pri vseh predmetih, saj je ta kompetenca nujna za uspešnost tako pri šolanju, kot pri vseživljenjskem učenju in pri uspešnosti spopadanja z vsakodnevnimi problemi odraslega življenja.

CLASSIFYING FRUITS AND UNDERSTANDING NATURAL DIVERSITY
/
PREPOZNAVANJE PLODOV PRI ZAČETNEM NARAVOSLOVJU

Barbara Bajd

Univerza v Ljubljani, Pedagoška fakulteta

barbara.bajd@guest.arnes.si

ABSTRACT

For effective science teaching it is necessary to provide children with opportunities in which they can engage with nature using all their senses, so that they directly experience as many aspects of natural diversity as possible. Such real, direct experiences of the natural world are, for children, the best teacher of all.

For example, through encouraging children to differentiate, describe and classify fruits, we promote and develop several of their crucial processing skills: observing with different senses, sorting, ordering, classifying, counting, measuring, weighting and comparing. Classifying fruits is an activity that can be performed with children of different ages and abilities using familiar, easily available materials. Observing, sorting, ordering and classifying are also the first steps to understanding natural diversity and introduce children in an easy and familiar way to reading biological keys.

UVOD

Otroci že v vrtcu spoznavajo naravo, živali in rastline ter njihove dele, kot so list, korenina cvet in plod. V vsakdanjem življenju velikokrat uporabljamo besedo plod, ki pa ni mišljena kot botanična opredelitev ploda. Včasih govorimo o plodu celoletnega truda, o plodu domišljije in pri tem ne mislimo na rastlinski plod. Velikokrat namesto besede plod uporabljamo besedo sadež ali sadje, kar lahko vodi do napačnega razumevanja botanične definicije ploda.

Pri začetnem naravoslovju otroke usmerjamo v opazovanje in spoznavanje plodov in pri tem razvijamo naravoslovne postopke. Eden prvih postopkov je natančno opazovanje, primerjanje, razvrščanje, urejanje, uvrščanje, merjenje in tehtanje (Harlow, 1992, Ferbar, 1996). Poleg tega otroke seznanimo, kako so zgrajeni preprosti biološki ključi za določanje organizmov (Bajd, 2001, Bajd 2002). Pri opazovanju otroci uporabljajo različna čutila. Zato je spoznavanje plodov, ki so užitni, za otroke zelo zanimivo, saj lahko uporabijo več čutil (tudi okus) in si tako značilnosti posameznih plodov tudi bolje zapomnijo. Pri prepoznavanju in razvrščanju plodov pa se otroci učijo različnih spremenljivk, ki jim kasneje pomagajo pri branju preprostih bioloških ključev za določanje organizmov.

Razvrščanje plodov je ena od aktivnosti, ki jo lahko izvajajo otroci različnih starosti in sposobnosti. Pri tem uporabljajo različna čutila, ne samo vid ampak tudi vonj, okus in tip.

Celo odrasli imajo včasih težave pri prepoznavanju plodov, zlasti če jim ponudimo zbirko, v kateri je veliko različnih predstavnikov sadja in zelenjave. Problem se pojavi, ker nimamo natančne definicije sadja in zelenjave. Angleži sadje imenujejo »fruit« in pomeni isto kot plod. Še večja zmeda pa nastane, ko govorimo o sadežih (na primer gozdni sadeži, kamor prištevamo gobe, borovnice, jagode). Gobe niso ne sadež, ne plod in jih uvrščamo v posebno kraljestvo gliv. Plodove imajo rastline iz skupine semenk, ko po oploditvi iz cveta nastane plod in v njem seme. Iz semena pa zraste v ugodnih razmerah nova rastlina. Goba nima ne cveta ne ploda. Kako lahko otroke seznanimo, kaj je plod? Kaj je definicija sadja in kaj zelenjave?

METODA

Otrokom ponudimo zbirko različnih plodov, ki se razlikujejo po velikosti, barvi, obliki. Nekateri so na otip kosmati (breskev, kokosov oreh, kivi). Tako lahko zbirka vsebuje jabolka (različnih barv, velikosti in oblik), pomarančo, banano, slivo, breskev, limono, kivi, kumaro, paradižnik, jajčevec, papriko, bučko. Če delamo s starejšimi otroki lahko poleg plodov damo v zbirko tudi korenje, cvetačo, krompir, čebulo, torej rastlinske dele, ki jih uporabljamo v prehrani, vendar niso plodovi.

Tako otroke najprej prosimo, da razvrstijo plodove po lastnem kriteriju. Najprej morajo otroci vedeti, kaj je plod, in tiste rastline, ki niso plod izločiti iz zbirke. Marsikdo ne posluša natančno navodil in začne tako z razvrščanjem. Tu nastane kar nekaj težav, toda po pogovoru in natančnem ogledu spoznajo, da plod vsebuje seme in da tisti deli rastlin, ki nimajo semen, niso pravi plodovi. Pogovorimo se, kateri del rastline je korenje, krompir, čebula ali cvetača. Ko otroci spoznajo, kaj je plod in kaj ni, ostale plodove začnejo razvrščati po različnih kriterijih. Pogosto izberejo za kriterij barvo ali obliko.

Barva

Pomembno je, da damo v zbirko plodove iste vrste, vendar različnih barv ali oblik. Tako naj bodo jabolka zelena, rdeča, rumena. Razlikujejo naj se tudi po obliki in po otipu lupine (na primer kosmač). Prav tako lahko damo v zbirko paprike različnih barv, oblik in velikosti. Tako otroci vidijo, da pride vsako jabolko, ki je drugačne barve, v svojo skupino, čeprav so vsi plodovi jabolka. V posamezni barvni skupini pa lahko uvedemo tudi urejanje, tako da otroci uredijo plodove od najbolj rdeče do najmanj rdeče.

Oblika

Če je kriterij oblika, bo večina jabolk v isti skupini, ne glede na barvo, saj so bolj ali manj iste oblike. Podobno lahko naredimo tudi s papriko. Tudi papriko lahko otroci razvrstijo po barvi. Če je kriterij oblika, pa dobimo najmanj tri skupine (podolgovate, okrogle in nepravilne). V skupini okroglih plodov bodo jabolka, paradižnik, grenivka, pomaranča, breskev. Med podolgovatimi plodovi bodo kumare, bučke, banane, čili, sladka paprika. Med nepravilnimi bosta, na primer, hruška in jajčevec.

Velikost

Če plodove razvrščamo po velikosti, moramo najprej določiti srednjo vrednost. Vsi plodovi, ki so večji od srednje vrednosti, gredo v eno skupino, in tisti, ki so manjši od srednje vrednosti, gredo v drugo skupino. Kasneje lahko plodove tudi uredijo od najmanjšega do največjega.

Okus

Otroku lahko zavežemo oči in mu ponudimo različne koščke plodov, da jih razvrsti po kriteriju »všeč mi je » ali »ni mi všeč«. Lahko pa jih tudi prepoznava po okusu.

Vonj

Prav tako lahko z zavezanimi očmi otroci prepoznavajo plodove po vonju. Kriterij je, ali mi je vonj všeč, ali ne. Mnogo teže pa je prepoznavanje plodov po vonju.

Tip

Tudi prepoznavanje plodov po otipu izvedemo z zavezanimi očmi. Otroci morajo vedeti, kaj je gladko in kaj hrapavo. Nekateri otroci ugotovijo, da so plodovi mehki, vlažni, trdi ali suhi. Tako lahko pri tej dejavnosti otroci bogatijo besedni zaklad.

Teža

Otroci lahko plodove razvrščajo po teži. Pri tem potrebujejo prevesno tehtnico. Zopet določimo srednjo vrednost. Vsi plodovi, ki so težji od srednje vrednosti, gredo v eno skupino, drugi, težji, v drugo skupino. Zopet lahko na koncu plodove uredimo od najtežjega do najlažjega.

Plovnost

Otroci lahko najprej napovedo in naredijo seznam, kateri plodovi bodo po njihovem mnenju plavali in kateri ne. V kadičko polagajo plodove in ugotavljajo plovnost. Rezultate vnesejo v razpredelnico in primerjajo napoved z zaključenim poizkusom.

Tako otroci spoznavajo, kaj so plodovi, in z različnimi čutili ugotavljajo, po čem se razlikujejo. Na koncu lahko otroci plodove narišejo, pobarvajo in poimenujejo. Aktivnosti lahko razširimo z razmišljanjem, zakaj nekateri plodovi pri nas uspevajo in nekateri ne. Pogovarjamo se o pogojih za rast, kakšno temperaturo in vlago potrebujejo različne vrste rastlin, katerih plodove uživamo, in kako pripeljejo plodove do nas. Zakaj nekatere rastline, ki niso pri nas domorodne, uspevajo in nekatere ne.

Na koncu vseh dejavnosti lahko naredijo sadno solato in uživajo v različnih okusih in vonjavah.

DISKUSIJA

Te aktivnosti smo večkrat preizkusili z učenci različnih starosti kot tudi s študenti in učitelji in vzgojitelji. Učitelji so razvrščali po drugačnih kriterijih kot otroci. Predvsem so učitelji uporabili kriterij »sadje in zelenjava«, za katerega pa nimamo natančne definicije in je zato delitev zelo težka, čeprav se uporablja v vsakdanjem življenju. Prav tako so imeli tako otroci kot učitelji težave pri določanju, kaj je zemeljski oreščєk, ali je plod ali je podzemno steblo. Čeprav smo se pogovorili, kaj je definicija ploda, mnoge zavede, da se plod ne more razviti v prsti.

Kako velika naj bo zbirka plodov, je odvisno od tega, kaj želimo s temi dejavnostmi doseči in od starosti otrok. Za krajšo dejavnost je dovolj, da prinesemo zbirko različnih jabolk, ki se razlikujejo po obliki, velikost, barvi, zgradbi lupine in okusu.

V zbirko v višjih razredih lahko dodamo plodove različnih gozdnih dreves. Lahko se pogovarjamo o tem, kako se raznašajo plodovi v naravi in kakšne imajo prilagoditve, da jih lahko raznaša veter, živali, voda ali človek. Nekateri imajo samosprožilne mehanizme. Plodovi, ki jih raznaša veter imajo različne letalne pripomočke, s katerimi jadrajo po zraku. Lahko ugotavljamo, kako daleč letijo plodovi, če jih spustimo z določene višine. Tako otroci spoznajo različne načine raznašanja plodov in njihovih semen. Pogovarjamo se tudi, zakaj je pomembno, da se semena razširjajo proč od matične rastline. Otroci plodove prerežejo in si ogledajo semena. Nekatere rastline imajo veliko semen, nekatera samo eno. Razlikujejo se ne samo po številu, ampak tudi po velikosti, obliki in barvi. Semena lahko otroci posadijo in ugotavljajo, kakšni so pogoji za uspešno kalitev semen. Opazujejo, koliko semen vzkali, zakaj nekatera semena ne vzkalijo in podobno. Dejavnosti s plodovi, kot smo jih opisali, pomagajo otrokom razvijati naravoslovne postopke, tako da znajo bolje opazovati razlike in podobnosti med organizmi. Tak način dela je za otroke bolj zanimiv, saj so sami vključeni v raziskovanje in s tem bolj motivirani in bolj radovedni. Pomembno je tudi, da otroci delajo s pravim materialom in ga lahko spoznavajo z različnimi čutili. Učitelju ni potrebno natančno opisovati značilnosti plodov, ampak otroke samo usmerja v spoznavanje in doživljanje narave.

ABSTRACT

Teachers often ask themselves how to teach so that pupils will learn in an interesting and effective way. We want to find out how to approach scientific subjects to pupils and how to overcome the stereotypical image of children that scientific subjects are too difficult, uninteresting and useless for life or further education. The aim of the presentation is to show one of the methods how to overcome or facilitate this problem. Meanwhile, we want to build the so-called vertical link among scientific educational themes from the first to the seventh grade of Science. Consequently, we focus on a pupil learning to observe, actively cooperate and describe natural phenomena and processes around him/her.

Keywords: *observe, cooperate, describe, Science, vertical link*

UVOD

Spoznavanje narave, tehnološkega okolja ter življenjskih in tehnoloških procesov igra pomembno vlogo pri vzgoji, izobraževanju in oblikovanju osebnostnih lastnosti mladega človeka. Cilj današnje vzgoje je razviti učenca kot ustvarjalno bitje, ga naučiti samostojno razmišljati in pridobivati novo znanje, ga motivirati za vseživljensko učenje in vzpostaviti pristen stik z okoljem. V učnem procesu učenci prihajajo do različnih spoznanj z neposrednim opazovanjem narave in okolja. Na tem temelji pouk naravoslovnih ved.

Na predmetni stopnji od šestega do devetega razreda učitelji opažamo, da so naravoslovni predmeti manj priljubljeni, učenci imajo pred njimi predsodke, pogosto so prepričani, da so ti predmeti težki in da jih preprosto nikoli ne bodo razumeli. Napačna prepričanja izvirajo od doma, pa tudi od starejših vrstnikov.

Z zanimivimi dnevi dejavnosti v nižjih razredih osnovne šole in tradicionalnimi zanimivimi novoletnimi poskusi želimo učencem pokazati, da je lahko naravoslovje zanimivo in nič zapleteno.

METODA

Delo je potekalo v razredih prve in druge triade osnovne šole. V raziskavo je bilo vključenih 160 učencev iz OŠ Frana Albrehta Kamnik. Izbrane teme so spoznali s skupinsko učno obliko, samostojnim ter demonstracijskim delom. Pri tem so bili vključeni vsi trije učni stili; tako vizualni, aditivni in kinestetični. Izvedeni so bili štirje naravoslovni dnevi z naslovom Opazujem, sodelujem, opisujem in Novoletni eksperimenti. Pri načrtovanju so sodelovali učiteljice naravoslovja in učiteljice, ki poučujejo v prvih dveh triadah. Učne teme so bile izbrane glede na letni učni načrt posameznih razredov zato je naravoslovni dan lažje vključiti v letni delovni načrt razreda. Po opravljenih dejavnostih smo z anketo povprašali učence in učiteljice po mnenju o naravoslovnem dnevu.

REZULTATI

Novoletne poskuse na naši šoli izvajamo že dlje časa. Letos smo povprašali učence, ki so izbrali izbirni predmet poskusi v kemiji, kaj je vplivalo na njihovo izbiro. 60 % učencev se je za ta predmet odločilo zaradi novoletnih poskusov, 10 % pa zardi učiteljice, ki je novoletne poskuse izvedla.

Učitelji, pri katerih smo izvedli naravoslovne dneve, vidi največjo prednost le teh v sodelovanju med učitelji v prvi in drugi triadi z učitelji naravoslovja. Podobnega sodelovanja si želijo več, razširili bi ga tudi na sodelovanje pri drugih naravoslovnih temah, obravnavanih pri rednih urah. Izbrane teme so se jim zdele dobre, želijo pa si več vpliva na izbiro tem. Menijo, da so se učenci dobro odzvali na dejavnosti, čeprav so bila pričakovanja nekoliko višja. Menijo, da tovrstno delo ne vpliva na učenčevo razmišljanje o naravoslovnih predmetih.

Učenci so naravoslovne dneve ocenili zelo dobro, večinoma z najvišjo ali drugo najvišjo oceno. Na vprašanje, kaj jim je bilo najbolj ali najmanj všeč, so bili odgovori zelo razpršeni; nekoliko izstopajo kemijske vsebine (60 %). Menimo, da smo pokrili raznolike teme in s tem zadovoljili želje različnih učencev. Mnogim je bilo zelo všeč (75 %), da so lahko sami eksperimentirali.

ZAKLJUČEK

Izkušnje s sodelovanjem so zelo dobre. Podobno kot spremljamo učinek novoletnih poskusov na izbiro izbirnih predmetov, bomo v prihodnje spremljali vplive tovrstnih naravoslovnih dni na odnos učencev do naravoslovja ter se trudili, da bi ohranili in izboljšali sodelovanje učiteljev.

ABSTRACT

Amount of information and resulting knowledge needed for competitive inclusion of any individual or institution into knowledge society is rising constantly. At the same time, life span of knowledge is decreasing. Lifelong learning is playing very important role in the modern times, as almost any individual, independent of age or occupation is required to gain new knowledge over and over. Changes and adaptations of traditional learning methods and educational systems are needed in order to prevent the divide between those that have the knowledge needed and those that don't. It is important to state that each individual starts learning within the formal educational system. Adaptation of elementary educational system is therefore most important and will have positive consequences on all other educational systems that individuals meet during lifetime. Changes and adaptations of educational systems are very much related to ICT, which can act as a tool that fosters these changes, also they should be implemented because of completely different reasons.

Supporting ICT and Multimedia are in many cases mature enough to be systematically introduced into educational process. It is not only about making education more appealing, but also due to reasons of increasing effectiveness in education. Use of ICT is oriented towards constructive learning, whereas in many cases learning goals can be achieved easier and faster. Use of ICT in education also decreases digital divide and increases competitiveness of work force.

In this article, all aspects of systematic ICT introduction into education are presented. Necessary organizational changes, as well as modern pedagogical approaches, enabled by the use of ICT are described. The article focuses on the changing role of educational practitioners and presents complete ICT and multimedia supported educational system, ranging from technologies, virtual and real environments as well as content and support needed. Important issues that prevent necessary changes of educational systems on the bigger scale are described and commented upon.

UVOD – ŠOLSKI SISTEM DANES IN JUTRI

Šolski sistem kot ga poznamo in v veliki meri uporabljamo še danes je nastal sredi 19. stoletja kot odgovor na »odsotnost staršev z doma« zaradi njihove zaposlitve v tovarnah. V času razvoja industrijske družbe je bil prilagojen »vzgajanju« delovne sile, ki ji je bilo potrebno vcepiti določena znanja in sposobnosti, ki so bile potrebne za življenje in so vključevale le elementarna znanja. Znanja, ki so jih potrebovali na svojem delovnem mestu in v življenju po šolanju, pa so praviloma vključevala repetitivne aktivnosti in se niso spreminjala.

Šolski sistem je bil narejen po principu »one size fits all«, torej je združeval npr. 30 povsem različnih posameznikov in jim ponudil popolnoma enake vsebine in didaktične metode. Tu nastopi eden izmed osnovnih problemov, saj so ljudje v osnovi različni, torej nadarjeni za različna področja učenja in dela, z različnimi željami in značaji, formalni šolski sistem pa še danes v večini temelji na predpostavki, da so vsi enaki.

Tak sistem izobraževanja je doživel svoj vrhunec tekom 20. stoletja in je ostal praktično nespremenjen do danes, navkljub popolnoma revolucionarnim tehnološkim spremembam, ki so se v tem času zgodile na vseh ostalih področjih dela in življenja.

Predmetniki v šolah so še vedno večinoma namenjeni pridobivanju znanj repetitivne narave in ne pridobivanju znanj/veščin, ki so dejansko potrebne oziroma zaželjene v vsakdanjem življenju in delu. Izobraževalni programi v veliki meri ne odražajo potreb podjetij in veščin, ki jih le-ta pričakujejo od svojih bodočih sodelavcev. Tako nastaja razkorak med pričakovanji in zahtevami delodajalcev ter dejanskm znanjem in usposobljenostjo kadrov (ang. credibility gap).

Precejšen problem v šolskem sistemu predstavlja tudi zastarelost in neprimernost ocenjevalnega sistema, ki zgolj preverja sposobnost reprodukcije že poznanih dejstev do neke določene odstotne stopnje, ki naj bi zadostovala za strokovno usposobljenost.

V okviru največjega svetovnega dogodka s področja tehnološko podprtega izobraževanja, EDUCA-ONLINE, ki vsako leto poteka v Berlinu, Nemčija, je bila ena izmed osnovnih ugotovitev plenarnih diskusij, da obstoječi šolski sistemi v Evropi v večini niso sposobni ponuditi »vizije sveta«, ampak zgolj »svet tak kot je«.

V okviru zgoraj navedenih trditev, je potrebno ponuditi sistemske rešitve, ki bodo prilagodile formalne sisteme izobraževanja. Šole, na vseh stopnjah višjih od osnovne, bi morale ponujati vsebine, predvsem pa pedagoške pristope izobraževanj, ki bi bili prilagojeni potrebam in željam učencev. Šolski sistem bi moral vzpodbujati pluralnost in dajati navdih vsem, ki si upajo in zmorejo misliti drugače od uniformirane večine. V sami osnovi ne sme vzpodbujati zgolj tistih, ki so sposobni odličnega branja in pisanja, ampak tudi vseh, ki se lahko izražajo ali razmišljajo na druge načine in odstopajo od uveljavljenega povprečja. Tako je ključnega pomena identificirati, oziroma razlikovati »sposobnost učenja« od »nadarjenosti«. Prvo je veščina, ki se jo je mogoče priučiti, drugo je redka lastnost izjemnih posameznikov. Prilagajanje izobraževalnega sistema tako zahteva organizacijske spremembe, ki po eni strani poudarjajo samostojnost, po drugi strani pa hitro odzivnost na spremembe, ki v sodobnem času, poleg individualnosti, dajejo poseben pomen skupinskemu delu na vseh področjih.

INOVATIVNI DIDAKTIČNI PRISTOPI IN IKT (UČITELJ NE POUČUJE, TEMVEČ MODERIRA IN POMAGA!)

Kot opisano že v uvodu inovativni didaktični pristopi temeljijo na konstrukciji oziroma izgradnji znanja.

Kot najbolj pomembne lahko izpostavimo različne oblike sodelovalnega oziroma projektnega dela učencev, ki se zaključi z določenim izdelkom. Če so pri tem uporabljene sodobne IKT, ki praviloma (ob primerni uporabi) predstavljajo dober motivacijski vzvod, je možno take načine učenja izvajati v širšem obsegu kot v preteklosti. Čas, ki je potreben od procesa učenja do končnega izdelka, je lahko veliko krajši, sodobne tehnologije pa omogočajo enostavno izdelavo digitalnih vsebin s strani udeležencev (ang. user generated content). Kot pomembno prednost uporabe IKT lahko izpostavimo tudi možnost enostavnega in prostorsko neomejenega deljenja izdelkov z drugimi učenci.

Inovativni didaktični pristopi lahko temeljijo tudi na izvedbi specifičnih učnih ur, podprtih z IKT kot učnim pripomočkom in orodjem, ter multimedisjkimi vsebinami pripravljenimi posebej za izvedbo. Kot primer lahko navedemo uporabo digitalnih izobraževalnih iger v učnem procesu. Digitalne igre, oziroma igre nasploh, imajo velik motivacijski potencial, saj ob uporabi sodobne terminalne IKT opreme praviloma obsegajo tudi zanimivo vsebino, ki ustvari poseben “navidezni svet” in igralca povsem prevzame (ang. immersive activity). Različni tipi obstoječih iger, od repetitivnih, iger, kjer igralec prevzame določeno vlogo, do pustolovskih in raziskujočih so lahko ob prilagoditvah zelo dobro uporabljive v izobraževalnem procesu. Igrajo jih lahko posamezniki ali pa skupine, v živo, oziroma na daljavo preko spleta.

Če k takemu načinu izvedbe učnih ur dodamo še komponento mobilnosti, ki jo odraža uporaba mobilne IKT terminalne opreme in brezžičnega dostopa do spleta (vsebin), lahko učni proces izvajamo s pomočjo iger ali sodelovalnega dela tudi v realnem svetu izven učilnic in se tako izognemo potencialnim nevarnostim uporabe iger oziroma IKT (preveč časa porabljenega za zaslonom računalnika in izguba stika z realnostjo ter socialne komponente osebne interakcije).

Poleg opisanih obstaja še cela vrsta prilagojenih inovativnih didaktičnih pristopov, ki jih je možno izvajati s pomočjo IKT. Sodobne terminalne naprave (elektronske table, dlančniki, bralniki, pametni mobilni telefoni), programska oprema, digitalne multimedijske vsebine, elektronsko preverjanje znanja, ipd., omogočajo izvedbo prilagojenih učnih ur, ki popestrijo učni proces. Hkrati omogočajo izgradnjo znanja povezanega z rezultati in izdelki učne ure in nenazadnje pridobivanje drugih, mehkih veščin (sodelovanje v skupini, spoznavanje tehnik učenja, razločevanje ter kritično vrednotenje relevantnih podatkov in informacij in drugo).

Za vse opisane pristope je značilna sprememba vloge učitelja. Le-ta ni več zadolžen izključno za poučevanje, temveč za podporo in izvajanje moderiranja učnega procesa. Sprememba vloge učitelja se neposredno odraža tudi na načinu dela, pripravi učnih ur in pri sami izvedbi. Pogosto to pomeni potrebo po večji inovativnosti izvajalcev, v praksi pa to pomeni več časa potrebnega za pripravo učnih ur, prilagajanje potrebam posameznih učencev in manj ustaljenih repetitivnih aktivnosti. Vse to rezultira v potrebi po prilagajanju celotnega šolskega sistema. Delo izvajalcev je potrebno prevrednotiti, poenostaviti administrativne in druge aktivnosti, ki se ne nanašjo na pedagoško delo in jim predvsem omogočiti vse pogoje, da se lahko primerno odzovejo na sodobne razmere.

IZOBRAŽEVALNI PROCES IN IKT (E-ŠOLA NI NAVIDEZNA ŠOLA!)

V predhodno zapisanih potrebah po spremembah šolskega sistema kot tudi izvedbe učnega procesa imajo IKT in multimedija lahko poseben pomen kot učinkovito podporno okolje in orodje(a) za uveljavitev sprememb na vseh ravneh izobraževalnega procesa. Za množico tehnologij, storitev in vsebin lahko rečemo, da so v današnjem času že preizkušene in uporabljive v izobraževalnem procesu. Hiter razvoj na tem področju zahteva nenehno uvajanje, ocenjevanje in preizkušanje novih. V nasprotnem primeru se lahko zgodi, da z formalni izobraževalni proces močno izgubi stik s potrebami sodobnega časa.

Ko govorimo o IKT podprtem učenju, naslavljamo več ravni in sicer:

- raven izvajalcev izobraževalnega procesa,
- raven udeležencev (učencev, dijakov, študentov).

Na ravni izvajalcev izobraževalnega procesa je potrebno zagotoviti predpogoj za uspešno uporabo IKT. Ta predpogoj se nanaša na informacijsko pismenost izvajalcev, ki ni nujno enaka informacijski pismenosti ostale populacije. Informacijska pismenost učiteljev mora odgovoriti na vprašanje, kako učinkovito uporabiti sodobne IKT in multimedijo z didaktičnega stališča, samo poznavanje delovanja tehnologij, storitev in vsebin pa pri tem ni ključnega pomena. IKT in multimedija sta le učinkovito orodje, šele pravilna uporaba le-tega pa ustvari dodano vrednost v izobraževalnem procesu.

Sistematsko usposabljanje najširšega kroga izvajalcev formalnega izobraževanja za rabo IKT je zato prerdpogoj za učinkovito uporabo IKT. To usposabljanje mora potekati v osnovni in “nadaljevalni” obliki. Osnovno izobraževanje naj bo modularno (z izbirnimi vsebinami), a enako za vse izvajalce ne glede na predmetno področje. Osnovnega usposabljanja po izkušnjah držav, ki tako obliko izvajajo že več let, ni možno izvesti v obliki kratkih delavnic v živo, temveč predvsem v obliki večmesečnega praktičnega dela (praktične uporabe sodobnih IKT) in dela na daljavo. Napredno usposabljanje naj bo usmerjeno na prilagojeno uporabo izbranih IKT v določenih predmetnih področjih in ravneh izobraževanja, poteka pa lahko v obliki kratkih, eno ali večdnevnih delavnic oziroma tudi na daljavo. Enako pomembno je redno obnavljanje in posodabljanje pridobljenih znanj, četudi je le-to časovno in finačno enako zahteven zalogaj.

V Sloveniji to področje zaenkrat, kljub velikemu številu kratkih in raznolikih usposabljanj, ni sistemsko urejeno, zato bi se veljalo zgledovati po nekaterih evropskih državah, ki imajo s sistemsko uvedbo IKT usposabljanj za učitelje desetletne izkušnje, in prenesti primere dobre prakse ter jih prilagoditi na specifičnosti slovenskega šolskega sistema.

Opisani predpogoj, e-kompetentni izvajalec izobraževalnega procesa, predstavlja podlago za uspešno uporabo inovativnih didaktičnih pristopov s podporo IKT in multimedije, saj se izvajalci z omenjenimi pristopi v praksi praviloma srečajo že v času usposabljanja in jih po opravljenem usposabljanju le bolj redno in uspešno (s pridobljenimi izkušnjami) uporabljajo v izobraževanju.

Na ravni udeležencev (učencev) v izobraževalnem sistemu je digitalna / informacijska pismenost enako pomembna kot na ravni izvajalcev, vendar ima druge poudarke.

Sposobnost uporabe novih tehnologij in medijev mora biti povezana z zmožnostjo kritičnega sprejemanja, vrednotenja in povzemanja informacij, pridobljenih s pomočjo (uporabniško-generiranih in drugih) baz podatkov ter informacijskih virov, ki so na voljo. Sposobnost uporabe je znova le predpogoj, opisane zmožnosti pa so predmet uvedbe in izvedbe inovativnih didaktičnih pristopov, ki učence privajajo na način sprejemanja znanja kot je opisan predhodno.

V nadaljevanju so, poleg IKT prilagojenega upsosabljanja, opisane štiri pomembne komponente, ki morajo biti podprte zavoljo uspešne uporabe IKT v v formalnem izobraževalnem procesu. To so:

- multimedijske vsebine izobraževanja,
- sodobno spletno izobraževalno okolje,
- tehnična in strokovna didaktična podpora in
- aktivno sodelovanje z razvojno raziskovalnim sektorjem.

MULTIMEDIJSKE VSEBINE IZOBRAŽEVANJA

Multimedijske vsebine predstavljajo alternativo obstoječim vsebinam v izobraževalnem procesu. Tako je poudarek na izobraževalnih vsebinah, ki jih je možno digitalno predstaviti v vizualno privlačni obliki, ter jim dodati interaktivnost. Predstavitev vsebine v digitalni obliki ni potrebna le zaradi vizualne privlačnosti, temveč predvsem zaradi lažje razumljivosti, pogosto pa predstavitev vsebine v digitalni obliki odpre različne poglede na vsebino, ki jih s klasičnimi metodami prikaza (učbeniki) enostavno ni mogoče izvesti. Interaktivnost vsebine, oziroma zmožnost vplivanja učencev na vsebino in odziv vsebine je enako pomemben razlog za izdelavo multimedijskih vsebin. Nenazadnje sodobne IKT in multimedija omogočajo daljinsko dostopnost izobraževalnih vsebin, komurkoli, kadarkoli in od koderkoli.

Multimedijske vsebine lahko razdelimo na tri osnovne tipe:

- e-učbeniki,
- specifične multimedijske vsebine, ki se nanašajo na izbrano ožje predmetno področje, so prilagojene uporabi specifične IKT ali pa specifičnega didaktičnega pristopa in
- uporabniško generirane vsebine izvajalcev in učencev.

E-UČBENIKI

E-učbeniki so profesionalne vsebine, ki celovito pokrivajo predmetna učna področja, vsebino pa predstavljajo z uporabo interaktivnih multimedijskih gradnikov, naprednih digitalnih animacij in videom, kjer je to možno in zaželjeno. Za e-učbenike je potrebno ustvariti enakovredno okolje kot za klasične učbenike, kar v praksi pomeni, da bi njihova uporaba morala biti enakovredna uporabi klasičnih učbenikov. Poleg didaktične vrednosti razvoj e-učbenikov pomeni tudi občutno zmanjšanje stroškov in povečanje enostavnosti popravljanja in posodabljanja le-teh. Osnovni razvoj e-učbenika sicer predstavlja finančno večji zalogaj kot v primeru klasičnih učbenikov, vendar pri e-učbenikih ni stroškov vsakokratnega tiskanja, njihova dostopnost pa je enaka za vse, tako da se glede na velikost ciljne skupine učencev investicija v e-učbenike povrne v nekaj letih.

Uvedbo e-učbenikov mora spremljati sistemski pristop na nacionalni ravni, ki vključuje procese evalviranja in potrjevanja, hkrati pa je potreben razvoj tehnloškega okolja, v katerem bodo ti učbeniki uporabljeni tako s stani učiteljev kot tudi učencev. O sodobnem spletnem izobraževalnem okolju bo govora v naslednjem poglavju prispevka.

SPECIFIČNE MULTIMEDIJSKE VSEBINE

Specifične multimedijske imajo drugačen pomen in drugačne vidike uporabe v izobraževalnem procesu. Praviloma so to digitalne vsebine prilagojene za uporabo na določenem mediju. Kot primer lahko navedemo vsebine, prilagojene za delo z elektronsko tablo, ki so drugačne od vsebin namenjenih svetovnemu spletu, biti morajo bolj interaktivne, uporabljati prednosti kot tudi omejitve medija. Podobno velja za vsebine namenjene prikazu na mobilnih telefonih. V Sloveniji je bil za take digitalne izobraževalne vsebine uporabljen izraz "didaktična programska oprema".

Kot naslednja primera specifičnih vsebin so tudi vsebine digitalnih izobraževalnih iger, opisanih v predhodnem poglavju, ali pa samostojni profesionalni kratki video posnetki namenjeni vizualnemu prikazu izbrane vsebine v okviru učnih ur.

Specifične multimedijske vsebine presegajo okvir e-učbenikov, vendar sta njihov razvoj in izvedba ključnega pomena za izvedbo učnih ur, temelječih na inovativnih didaktičnih metodah in uporabi IKT. Specifične vsebine tako lahko obravnavamo kot potreben dodatek k e-učbenikom, njihov razvoj pa bi moral biti vključen v sistemskem pristopu uvedbe e-učbenikov na nacionalni ravni.

UPORABNIŠKO GENERIRANE VSEBINE

Le-te je potrebno obravnavati v smislu razširjanja uporabe IKT v učnem procesu in večjega vključevanja tako izvajalcev kot tudi udeležencev. Njihov razvoj je možen zavoljo uvajanja sodobnih razvojnih orodij, ki so vse bolj dostopna in enostavna za uporabo. Enako pomemben dejavnik je možnost deljenja uporabniško generiranih vsebin in posledično ustvarjanja in ohranjanja skupnosti izvajalcev kot tudi učencev z enakimi strokovnimi interesi, področji dela, hobiji, ipd. Izvajalci svoje uporabniško generirane vsebine lahko uporabljajo kot učne pripomočke za lastne potrebe, učencem pa lastne uporabniško generirane vsebine predstavljajo pomemben rezultat njihovega dela. Pri tem se znova soočimo z izzivom uvedbe sodobnega spletnega izobraževalnega okolja, ki mora na enostaven način podpreti vse procese povezane z ustvarjanjem in ohranjanjem skupnosti kot tudi nastajanjem in deljenjem uporabniško generirane vsebine.

SODOBNO SPLETNO IZOBRAŽEVALNO OKOLJE

Ko govorimo o sodobnem spletnem izobraževalnem okolju obravnavamo skupino povezanih različnih, porazdeljenih spletnih aplikacij. Spletne aplikacije lahko delimo glede na osnovno namembnost:

- aplikacije za dostop do podatkov, informacij, vsebin in znanja,
- aplikacije, s pomočjo katerih se izvaja izobraževalni proces (učno okolje).

V prvem primeru so to aplikacije, praviloma zbrane v okviru **nacionalnega izobraževalnega portala**. Izobraževalni portal je sestavljen iz več spletnih mest, kjer uporabniki dostopajo do specifičnih multimedijskih vsebin. Pri tem lahko izpostavimo video vsebine, vsebine za elektronske table in izobraževalne igre. Portal obsega tudi spletna mesta namenjena vzpostavitvi in vzdrževanju e-skupnosti učencev kot tudi izvajalcev z istimi interesi.

Nacionalni izobraževalni portal mora omogočiti dostop do tehnične in strokovno didaktične podpore, namenjene predvsem izvajalcem izobraževalnega procesa kot tudi učencem. Še najbolj pomembno je, da obsega enostavne in učinkovite iskalniške storitve, ki brskajo po nacionalni bazi e-vsebin, kot tudi po drugih primernih virih. Nacionalni izobraževalni portal predstavlja tudi vstopno točko do aplikacij, ki omogočajo informacijsko podporo izobraževalnemu procesu. To so lahko spletne redovalnice in različne aplikacije namenjene administrativnim aktivnostim izvajalcev izobraževalnega procesa. Celovito obravnavan portal tako omogoča tudi aktivno vključevanje staršev, ki so lahko bolje in ažurneje seznanjeni s potekom učnega procesa.

Učno okolje je sestavljeno iz porazdeljenih aplikacij, ki omogočajo izvedbo učnega procesa s pomočjo spletnih tehnologij in storitev. Ključne dejavnosti, ki naj jih sodobno učno okolje podpira, se nanašajo na orodja za razvoj vsebin, spletne učilnice, orodja namenjena komunikaciji, sodelovanju ter skupinskemu oziroma projektnemu delu, elektronsko preverjanje znanja, orodja za enostavno izgradnjo portfeljev učencev in učiteljev. Opisana orodja in okolja so podprta tudi z administrativnimi orodji, namenjenimi upravljanju izobraževalnega procesa, sledenju napredovanja uporabnikov ter evalvaciji poteka spletnega izobraževalnega procesa.

TEHNIČNA IN STROKOVNA DIDAKTIČNA PODPORA

Do zdaj smo govorili o vsebinskih aspektih in podpornih orodjih, ki omogočajo učinkovito izrabo IKT v izobraževalnem procesu in predstavljajo potrebne, vendar ne zadostne pogoje za široko uporabo IKT. Izvajalcem izobraževalnega procesa, ki uporabljajo omenjene tehnologije, storitve in vsebine je ob tem potrebno nuditi tudi primerno tehnično in strokovno didaktično podporo. V ta namen je potrebno zasnovati učinkovit **organizacijski model podpore in svetovanja**.

Tak model naj v osnovi vključuje kompetentne institucije, to so lahko svetovalna podjetja, akademske institucije, kot tudi izobraževalne institucije (npr. šole), ki imajo med zaposlenimi napredne posameznike, izvajalce izobraževalnega procesa. Prav ti, s svojim poznavanjem ciljnega okolja, lahko nudijo zelo kvalitetno podporo, vendar je v organizacijskem modelu nujno vzpostaviti medinstitucionalno sodelovanje in ne le sodelovanje na ravni posameznikov. Organizacijski model vključuje tudi vidike evalvacije in stalnega zagotavljanja kvalitete.

Podpora izvajalcem izobraževalnega procesa poteka na različne načine. Primeri dobre prakse kažejo, da je najboljša podpora tista, v kateri institucije, ki nudijo podporo, izvajajo mini projekte z izvajalci izobraževalnega procesa z uporabo izbranega pedagoškega pristopa ter IKT. Učitelji skozi praktično delo pridobijo največ kompetenc in izkušenj. Drugi vidik podpore je klasičen, bodisi z uporabo različnih komunikacijskih orodij, ki so na voljo na nacionalnem izobraževalnem portalu, ali pa z izvedbo krajših usposabljanja oziroma svetovanj.

Na tem mestu želimo poudariti, da vloga izobraževalnega sistema ni nujno izobraziti svetovalce, ki bodo nudili tehnično in strokovno didaktično podporo, temveč poskrbeti, da bo najširši krog izvajalcev izobraževalnega procesa primerno usposobljen za uporabo IKT pri pouku. Svetovalce je možno črpati iz nabora že obstoječih podjetij in institucij, ki se ukvarajajo s tem področjem ter iz nabora naprednih učiteljev, ki pa morajo svojo kompetentnost izkazati s svojimi izkušnjami in znanjem.

AKTIVNO SODELOVANJE Z RAZVOJNO RAZISKOVALNIM SEKTORJEM

Področje uporabe IKT v izobraževalnem procesu je zelo dinamično in se nenehno spreminja, glede na uvajanje novih tehnologij in storitev. Glede na to, da se razvojno raziskovalni sektor z novostmi na področju IKT najprej srečuje v okviru svojih analiz in raziskav, je potrebno poskrbeti, da izobraževalni sistem tesno sodeluje z akademskimi organizacijami s tega področja. To sodelovanje je možno izvajati v okviru pilotnih projektov, za katere pa je še najbolj pomemben segment evalvacije in diseminacije, ki bo zagotovil, da bodo primeri dobre prakse hitro prešli v praktično uporabo.

ZAKLJUČEK

V današnjem času obstaja večje število IKT podprtih storitev in vsebin, ki so zrele za širšo uporabo v izobraževalnem procesu. Pri tem ne gre le za popestritev izobraževanja, temveč za konkretne učinke, ki vplivajo na večjo učinkovitost, lažje doseganje izobraževalnih smotrov in širše gledano za povečanje informacijske pismenosti, zmanjšanje digitalnega razkoraka ter povečanje konkurenčnosti in usposobljenosti kadrov.

Podobno kot v drugih primerih uvedbe IKT na področja življenja in dela, se tudi pri izobraževanju pokaže, da proces sistematske uvedbe, ki edini prinese rezultate, ni preprost. Če se ob uvedbi ne prilagodi tudi sam izobraževalni process, rezultati uvedbe praviloma niso zadovoljivi.

Prilagajanje izobraževalnega procesa ne sme potekati zaradi IKT, temveč zavoljo povsem netehnoloških razlogov. IKT predstavljajo le skupek orodij, ki omogočajo enostavno izvedbo pedagoških pristopov, ki jih v preteklosti s širokim krogom učencev ni bilo možno izvesti, oziroma je bila ta izvedba povezana z velikimi finančnimi vložki. Pri tem mislimo predvsem na individualno obravnavanje potreb in zmožnosti učencev oziroma prilagajanje izobraževalnega procesa potrebam posameznika kot tudi bolj izraženo potrebo po konstruktivističnih pristopih v izobraževanju, na vseh ravneh izobraževalnega procesa.

Sistematski pristop k uvedbi IKT ne obravnava posameznih tehnologij, storitev in vsebin, temveč gleda na proces uvedbe kot na celoto. Zato je potrebno vzpostaviti okolje, ki bo podprlo vse vidike uvedbe: vsebine, orodja, podporo in prihodnji razvoj.

ABSTRACT

The article aims to demonstrate the technical day for students of the 9th class. We live in a time of declining stocks of fossil fuels is growing interest in renewable energy sources, which also include biomass. In the experimental work was used to determine how much heat emitted during combustion of different fuels. This was followed indirectly by measuring the temperature of the water to be heated to release heat from the burning of certain fuels. We also monitored the residue after burning of solid fuels. Samples of biofuels, which were used for experimental work were pellets, briquettes, sawdust, olive pulp, cherry pit (wet and dried), biodiesel, ethanol and fuel oil.

Keywords: *biofuel, biomass, technical day*

UVOD

Biomaso poimenujemo odmrli organski material, ki je v večini primerov rastlinskega izvora. Biomaso lahko uporabljamo za neposredno kurjenje, kot gorivo, pri čemer nastane toplotna energija.

Smo v obdobju, ko se zaradi vsestranske uporabe fosilnih goriv, počasi manjšajo njihove zaloge. Posledično pa vedno bolj narašča zanimanje za alternativne vire energije, med katere sodi tudi biomasa. Za oljčne tropine smo se odločili zato, ker živimo na območju, kjer pridelujejo oljčno olje in uporabljajo ostanke, ki nastanejo po stiskanju oljk, tudi kot gorivo v domačih pečeh za centralno ogrevanje. Kot gorivo pa se lahko uporabljajo tudi češnjeve koščice. V okviru tehniškega dne so učenci najprej teoretično spoznavali osnovne lastnosti biomase. V raziskovalnem delu pa so praktično s pomočjo eksperimentov ugotavljali: za koliko °C različna goriva segrejejo določeno količino vode in kolikšen je ostanek po gorenju trdnih goriv.

METODE

Pri delu z učenci smo uporabili naslednje metode: pregled in uporaba pisnih virov, eksperimentalno delo ter javna predstavitev rezultatov. Ugotavljali smo koliko toplote oddajajo pri gorenju različna goriva. To smo spremljali posredno, z merjenjem temperature vode, ki se segreje ob sproščanju toplote pri gorenju posameznega goriva.

Na list papirja smo zatehtali 20 g trdnega, oziroma 20 ml tekočega goriva v merilni valj. V aluminijasto posodico smo dali časopisni papir (0,9 g) in kurilno tabletko (3 g), tekoče gorivo pa smo nalili v gorilnik.

Na spodnje stojalo smo postavili posodico s trdim, oziroma gorilnik s tekočim gorivom, na zgornje stojalo pa mrežico in čašo s 50 ml vode. S termometrom smo izmerili začetno temperaturo vode in jo zabeležili. Nato smo prižgali kurilno tabletko in spremljali gorenje ter temperaturo vode. Odčitali smo jo vsakih 5 minut, temu je sledil zapis. Ko je vse gorivo zgorelo, smo zabeležili končno temperaturo vode in čas gorenja. Stehtali smo tudi maso ostankov po gorenju.

REZULTATI

Sprememba temperature vode pri uporabi različnih goriv

S poskusi smo ugotovili, da so goriva, kot so: etanol, nesušene češnjeve koščice in suhe oljčne tropine vodo najbolj segrela, in sicer za 70 °C. Najmanj se je voda segrela pri uporabi biodizla, le za 24 °C, pri ostalih uporabljenih gorivih pa je temperatura vode narasla za 43 do 63 °C..

Ostanek po gorenju trdnih goriv

Ugotovili smo, da so briketi skoraj popolnoma zgoreli, ostanka pri tem gorivu je najmanj. Največ ostanka po gorenju pustijo suhe oljčne tropine.

ZAKLJUČEK

Iz opravljenih poskusov smo ugotovili, da se toplota, ki jo oddajajo različne biomase pri gorenju razlikuje. Poleg tega nekatere biomase gorijo dlje, nekatere manj časa. Pri nekaterih vrstah biomase smo opazili, da temperatura nenehno narašča (etanol, kurilno olje, peleti, nesušene češnjeve koščice, nesušene oljčne tropine, suhe oljčne tropine), pri drugih pa doseže najvišjo možno temperaturo, nato pa začne upadati (biodizel, briketi, žagovina, suhe češnjeve koščice). Vsaka biomasa po gorenju pusti ostanek in sicer različno količino saj in pepela.

Prepletanje različnih metod dela je za učence zelo zanimivo, saj lahko aktivno sodelujejo pri izvajanju nalog, spodbuja jih k timskemu delu in aktivnemu razmišljanju. Ocenijo lahko svoja znanja in predvidevanja ter se učijo jasnega in javnega izražanja ugotovitev in svojega mnenja. Vse našteto, vključno z vsebino tehniškega dne, prispeva k večjemu zavedanju o pomenu odgovornega odnosa do sebe in drugih ter o dragocenosti narave in njenem varovanju.

THE ROLE OF THE PHYSICS DEVELOPMENT GROUP IN RENEWAL OF SECONDARY SCHOOL PHYSICS EDUCATION
/
VLOGA PREDMETNE RAZVOJNE SKUPINE ZA FIZIKO PRI POSODABLJANJU GIMNAZIJSKEGA POUKA FIZIKE

Samo Božič

Zavod RS za Šolstvo

samo.bozic@zrss.si

ABSTRACT

The Physics development group together with mentoring teachers is responsible for creating a vision of the high school physics course, for implementing and monitoring the syllabus, raising the quality of physics education, for in-service teacher training and creating optimum educational opportunities for students. Great attention is given to the development and dissemination of examples of good teaching practice. Educational materials which are being developed will be published in a handbook for teachers and in our virtual classroom to which physics teachers have access.

Keywords: *physics, modernization of general upper secondary school, example of good teaching practice, teacher training*

UVOD

V okviru projekta Posodobitev gimnazije so Predmetne komisije za posodabljanje in uvajanje učnih načrtov pripravile posodobljene učne načrte, ki so se za prve letnike gimnazijcev začeli uporabljati v šolskem letu 2008/09. Po sprejetju učnih načrtov so se Predmetne komisije preoblikovale v Predmetne razvojne skupine (v nadaljevanju PRS), ki naj bi permanentno skrbele za posodabljanje gimnazijskega pouka. PRS za fiziko je ekspertna skupina, ki skrbi za kreiranje vizije predmeta, za uvajanje in spremljanje učnih načrtov, dvig kvalitete pouka, usposabljanje učiteljev in ustvarjanje optimalnih možnosti izobraževanja dijakov.

METODA

PRS za fiziko sestavljajo univerzitetni profesorji iz kadrovskih fakultet, učitelji praktiki in svetovalci Zavoda Republike Slovenije za šolstvo. V nadaljevanju so PRS k sodelovanju povabile mentorske učitelje, katerih glavna naloga je razvojno delo, preizkušanje novosti v praksi, priprava didaktičnih gradiv za pouk in njihovo preizkušanje, samoevalvacija in sodelovanje pri spremljavi. Mentorski učitelji nudijo pomoč PRS pri izvedbi usposabljanj za vse učitelje fizike.

Osrednja pozornost je namenjena razvoju in širjenju primerov dobre prakse. V prvi fazi je bila naloga skupine določitev področij delovanja in sicer:

- iskanje uveljavljenih tujih in domačih didaktičnih gradiv,
- priprava didaktičnih gradiv za aktivne oblike in metode dela,
- eksperimentalne vaje dijakov,
- informacijska in komunikacijska tehnologija pri pouku fizike,
- zanimive izbirne vsebine in medpredmetno povezovanje,
- kratke projektne in seminarske naloge ter
- sodobnejši načini preverjanja in ocenjevanja znanja.

Za potrebe delovanja skupine, zbiranja nastajajočih gradiv in komunikacije med člani na daljavo je bila odprta spletna učilnica. Za posamezna področja so bila zapisana izhodišča za oblikovanje gradiv in dodan prostor za njihovo zbiranje ter odprti forumi v podporo komunikaciji na daljavo.

Skupina se trenutno nahaja v fazi razvijanja in testiranja didaktičnih gradiv za pouk. Na začetku je vsak član pripravil tri primere didaktičnih gradiv, ki po njegovem mnenju sledijo ciljem posodobljenega učnega načrta in omogočajo:

- razvijanje zmožnosti naravoslovnega razmišljanja (premišljeno opazovanje, kritično razmišljanje, argumentiranje, vrednotenje, posploševanje, modeliranje, samostojno reševanje problemov)
- aktivno vlogo dijakov,
- diferenciacijo - dodane bodo naloge za bolj motivirane in zmožnejše dijake,
- da bodo naloge osnovnega nivoja praviloma zmogli izvesti vsi dijaki.

V naslednjem koraku je sledilo medsebojno recenziranje gradiv, popravki avtorjev in njihova predstavitev posameznih gradiv in primerov prakse. Nato je vsak član pregledal vsa gradiva in se ob vsakem gradivu opredelil med tremi možnostmi:

- bom zagotovo uporabil/a,
- bom mogoče uporabil/a in
- verjetno ne bom uporabil/a.

Po opravljeni analizi je sledilo ponovno vrednotenje gradiv s posebnim poudarkom na primerih, pri katerih se je večina odločila za uporabo in primerih, pri katerih se je večina odločila, da jih verjetno ne bi uporabila. Mentorski učitelji so nato gradiva preizkušali pri pouku in avtorjem pošiljali povratne informacije o izvedbi. Glede na vse pridobljene izkušnje so člani začeli pripravljati drugi krog didaktičnih gradiv.

REZULTATI

Rezultati delovanja PRS skupaj z mentorski učitelji se kažejo skozi sodelovanje pri izvedbi srečanj študijskih skupin in usposabljanju učiteljev. Na srečanjih člani posredujejo spoznanja in širijo izkušnje ter primere dobre prakse vsem učiteljem fizike.

Nastajajo didaktična gradiva za pouk, ki vsebujejo:

- tabelo s kazalniki, ki učitelju podajo prvo informacijo o gradivu (naslov, avtor, kratek opis za učitelje, cilji, priporočilo za oblike in metode dela, priporočilo za izvedbo, predviden čas za izvedbo, zahtevnost in vključenost eksperimenta),

- učne liste za dijake,
- napotke za učitelje z opisom in fotografijo potrebne opreme in
- rezultate.

Nekaj primerov dobre rabe in didaktičnih gradiv je že bilo in bo še prikazanih na usposabljanjih učiteljev. V nastajanju je priročnik za učitelje, ki bo vseboval teoretični del in okrog sto gradiv za sodobnejši pouk fizike. Gradiva bodo objavljena tudi na zgoščenki in v spletni učilnici, do katere imajo dostop učitelji fizike.

ZAKLJUČEK

PRS za fiziko ima osrednjo vlogo pri posodabljanju gimnazijskega pouka fizike. Skupaj s skupino mentorskih učiteljev v sodelovanju z Zavodom RS za šolstvo načrtuje sodobne pristope in načine uvajanja novosti in skrbi za posodabljanje gimnazijskega pouka fizike. Na seminarjih prenaša dobre izkušnje in primere dobre prakse ostalim učiteljem fizike. V sklepni fazi projekta bo naloga PRS skupaj s pedagoškimi svetovalci in mentorskimi učitelji načrtovanje in izvedba spremljave gimnazijskega pouka na fizike.

MEASUREMENT
/
MERJENJE

Klavdija Brecelj

OŠ Ivana Roba Šempeter pri Gorici

klavdijabrecelj@gmail.com

ABSTRACT

Science subject teachers have perceived that pupils have problems with quantities and units of measurement. This abstract present a technical day – named »Measurement«. The pupils measured the length, area and volume with a non-standard and a standard unit. Before the measurement, each pupil wrote down the assessment of the sought quantity measurement. Their main goal was to connect the mathematical knowledge on measurement with experience and knowledge from other natural science fields and everyday life which would enable a better understanding and an easier way of solving problems. I have found out that this kind of work enables the pupils to use the known facts in a new situation and to acquire practical experience for a future understanding of abstract notions.

Keywords: *measurement, quantities of measurement, units of measurement, experience*

UVOD

V prispevku je prikazan tehnični dan »Merjenje«, ki sem ga izvajala v 7. razredu osnovne šole. Namenjen je bil merjenju dolžine, ploščine in prostornine. Učitelji opažamo, da učenci pogosto zamenjujejo enoto za mersko količino. K dani količini ne zapišejo pravih enot, ne poznajo pretvornikov med enotami iste količine in ne vedo, katere merske priprave uporabljamo za merjenje dane količine. Nimajo razjasnjenega pojma obseg in ploščina lika, ter površina in prostornina telesa. Obrazce za izračun naštetih količin se naučijo na pamet in jih pogosto zamenjujejo.

Zato je bil cilj tehničnega dne, da učenci matematično znanje o merjenju povežejo z izkušnjami in znanji iz drugih naravoslovnih področji, ter z vsakdanjim življenjem, kar bi jim omogočilo boljše razumevanje in lažje reševanje problemov.

METODA

Merjenje je naravoslovni postopek, pri katerem ugotavljamo, koliko izbranih enot vsebuje količina, ki jo merimo. Otroci se v vsakdanjem življenju že zelo zgodaj srečajo z merjenjem. Starši pogosto merijo njihove telesne razsežnosti: višino, maso, obseg pasu,…Med seboj se primerjajo in ugotavljajo, kdo je večji ali manjši, kdo je lažji ali težji,… Z merjenjem se srečajo tudi pri vsakdanjih opravilih: za pripravo peciva potrebujemo 4 jogurtove lončke moke, kruh smo spekli iz 1 kg moke, za obrobo prta je mama porabila 8m traku, darilo smo zavili v 1 polo papirja. Pri tem spoznajo standardne in nestandardne enote za merjenje količin.

Na razredni stopnji učenci najprej ocenjujejo in primerjajo količine, ter jih merijo z nestandardnimi enotami: s koraki, z dlanjo, s stopali,… Kasneje merijo dolžino, ploščino, prostornino in maso z standardnimi enotami. Meritve zapisujejo z merskim številom in mersko enoto, uporabljajo različne priprave za merjenje in s količinami računajo. Na razredni stopnji naj bi pouk slonel na izkušnjah otrok. Učenci naj bi razumeli proces merjenja in si pridobili predstave o velikosti obravnavanih enot. Zdi se mi zelo pomembno, da učenci na tej stopnji pridobijo predstave o dolžinskih enotah, saj jim to omogoča boljše predstave o enotah za merjenje ploščine in prostornine.

Enote za merjenje dolžine je na tej stopnji nujno povezati z deli telesa in tako krepiti predstave o dolžinskih enotah: 1m je razdalja med ramo in iztegnjeno roko pri odraslem človeku, 1 dm je razdalja med dvema iztegnjenima prstoma, 1cm je širina prsta, 1 mm je debelina nohta.

Na predmetni stopnji učitelji opažamo, da imajo učenci težave z velikostno predstavo posameznih enot. Učenci se odnosa med dvema enotama naučijo na pamet, zato pogosto prihaja do napak pri pretvarjanju mer. Le malo otrok na predmetni stopnji ima dobro razvite prostorske predstave, zato je potrebno tudi na predmetni stopnji izvajati določene aktivnosti in naloge, ter primere merjenj povezati z vsakdanjim življenjem.

REZULTATI

Učenci so bili razdeljeni v več skupin. Vsaka skupina je imela drugačno nalogo s področja merjenja. Dobili so liste z navodili za izvedbo naloge in ustrezne pripomočke. Delali so samostojno. Učitelj je imel le vlogo koordinatorja dela. Na koncu so poročali o svojem delu in naredili evalvacijo. Liste z nalogami sem učencem pobrala in ocenila njihovo delo.

Učenci so merili:

- dolžino: dolžino košarkarskega igrišča (s koraki), dolžino rokometnega igrišča (s palico),širino peskovnika (s papirnatim trakom), višino okna (s pedjo), dolžino gola (s palico), širino klopi (s slamico),

- ploščino: pravokotnika, ki ga sestavljajo ploščice pri umivalniku, panoja, šolske klopi, garderobnih vrat, vrat razreda, hodnika,

- prostornino: škatlice za čaj in predala, škatle za čevlje in omare, učbenika in omare, škatle riža in kartonaste škatle, škatlice zdravil (z zdrobom), akvarija (z vodo).

Vsak učenec je najprej zapisal svojo oceno meritve iskane količine. Nato so merili z nestandardno in s standardno enoto, ter meritve primerjali med seboj. Za merjenje ploščine so si izdelali m^2, dm^2 in cm^2, pri merjenju prostornine pa so si pomagali z enotskimi kockami. Računali so tudi obseg in površino.

Slika 1: Merjenje dolžine

Slika 2: Merjenje ploščine

Slika 3: Merjenje prostornine

ZAKLJUČEK

Učenci so si delo v skupini razdelili, Med seboj so komunicirali in se dogovarjali. Bili so mnenja, da so se s takim delom veliko naučili in si pridobili nove izkušnje. Ker so drug drugemu pomagali, so vsi rešili vse naloge. Ugotovili so, da sta učenca, ki sta merila dolžino igrišča vsak s svojo palico prišla do različnih rezultatov. Rezultat je bil odvisen od dolžine palice in njune natančnosti pri merjenju. Zaradi lažjega sporazumevanja je zato pri merjenju nujna vpeljava standardnih enot. Ugotovili so, da k merjenju dolžine spada tudi merjenje višine, širine in obsega, k merjenju ploščine pa površina teles. Pri nalogah so povezali enote za merjenje prostornine trdih teles z enotami za mejenje prostornine tekočin. Zelo radi so iz enotskih kock sestavljali telesa in jim določali prostornino.

Učenci so imeli najmanj težav pri ocenjevanju dolžin. Pri ocenjevanju ploščine in prostornine pa je pri nekaterih skupinah prišlo do večjih odstopanj med člani iste skupine. Skupina, ki je merila dolžino košarkarskega igrišča je dobila veliko razliko med izračunano dolžino s koraki in med izmerjeno dolžino. Napaka je nastala zaradi tega, ker so učenci napačno izmerili dolžino koraka.

Ker učenci pri poročanju ne znajo izluščiti bistva, smo za to porabili veliko časa, Taka oblika dela učencem omogoča uporabo znanega v novi situaciji in pridobivanje konkretne izkušnje za kasnejše razumevanje abstraktnih pojmov. Učenci so imeli pri pretvarjanju enot manj težav, saj so se naslonili na velikostne predstave, ki so jih pridobili pri praktičnem delu.

PHYSICS IS MORE INTERESTING IF IT IS RELATED TO TECHNOLOGY
/
POUK FIZIKE JE V POVEZAVI S TEHNIKO BOLJ ZANIMIV

Marija Cehner

OŠ Neznanih talcev Dravograd

marija.cehner1@guest.arnes.si

ABSTRACT

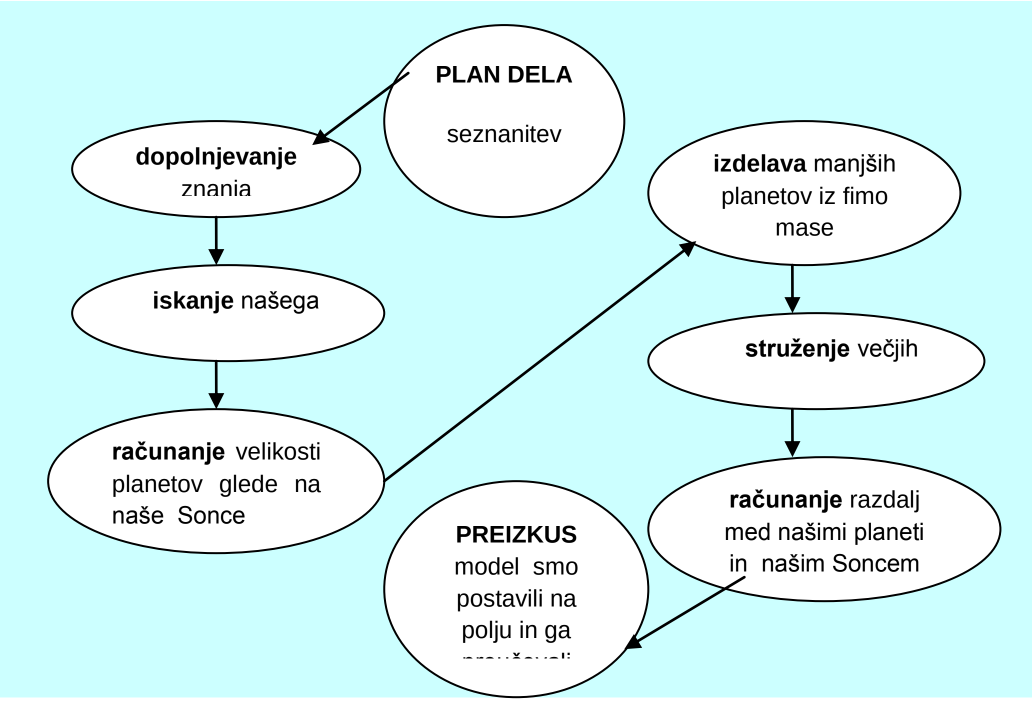
With the students of the subsidiary course of physics we made the model for our Solar system. For the model of the Sun we have used the big gym. For our project we calculated the distances in the measures of the size and the distance of the planets in our solar system. For the small sized planets we used the qualitative mass material, the big planets we made by turning and for the Sun we used a big gym ball. We applied the models of the planets in a natural field to be able to study and examine our project. Other students in the Class of Artificial materials took the challenge and build the car on elastic drive. For construction we searched for the best solution for the drive with two elastic ribbons. As a result of the hard work the two groups of students qualified for the national competition.

Keywords: *The Solar system model, turning, field, car on elastic drive, competition.*

UVOD

Pri poučevanju nenehno iščem poti za izvajanje takega pouka, da so učenci čim bolj aktivni. V projekt so se vključili učenci, ki kažejo večje zanimanje za tehniko in naravoslovje. Pri takih aktivnostih z motivacijo ni problemov. Pri dodatnem pouku v 9. razredu sem učence ob Mednarodnem letu astronomije navdušila za astronomijo in z učenci smo se odločili, da izdelamo model Našega osončja.

METODA



Slika 1: Metoda dela

REZULTATI

Za naše Sonce smo kupili rumeno žogo velikosti 75cm. Manjše planete smo ročno izdelali iz fimo mase, večje planete pa smo stružili iz umetnih snovi v šolski delavnici. Natovorili smo »celoten« sončni sistem, se odpeljali na ravno polje in postavili naš model sončnega sistema v preračunane razdalje ter proučevali, kaj se vidi iz Sonca in iz osmih planetov. Že prej smo si razdelili vloge. Iz mesta Neptuna nismo mogli opazovati planetov in Sonca, saj teren ni bil dovolj horizontalen.

Tabela 1: Izračunani podatki za naš primer velikosti Sonca 75cm.

Planet	Premer (cm)	Oddaljenost od našega Sonca (m)
MERKUR	0.28	32
VENERA	0.68	57
ZEMLJA	0.7	81
MARS	0.35	122
JUPITER	7.7	405
SATURN	6.6	769
URAN	2.6	1134
NEPTUN	2.52	2430

Izdelava elastmobila: V osmem razredu smo pri temi o prožnostni energiji preko spleta pregledali poročilo s tekmovanja o elastomobilih in učenci so sprejeli izziv, da tudi oni izdelajo elastomobil in izmerijo pot, ki jo naredi vozilo s prožnostno energijo navite elastike.

Konstruirali smo razne oblike, iskali rešitve za čim boljši pogon z dvema elastikama.

Vozilo smo izdelali pri izbirnem predmetu obdelava gradiv umetne snovi. Z različnimi konstrukcijami modelov vozil smo dosegli različno dolgo pot in ugotovili, da vozila z navito elastiko dosežejo boljši rezultat kot vozila na napeto elastiko. Pomembna je tudi velikost ter oblika vozila. Trenje med gibljivimi deli mora biti čim manjše, saj so navori majhni. Gibljive dele smo namazali s parafinskim oljem. Naše preizkuse smo primerjali z znanji iz fizike: upor, trenje, prožnostna energija, pretvarjanje energije, navor.

Na šolskem tekmovanju se je pomerilo 13 ekip. Z elastomobilom sta dve naši najboljši ekipi učencev uspešno tekmovali na državnem tekmovanju, saj sta dosegli prvo in tretje mesto.

ZAKLJUČEK

Predstavitev dela učencev na razstavi, intervju na lokalni televiziji ter nagradni obisk fizikov iz Hiše eksperimentov na šoli , kjer so prikazali zanimive poskuse za učitelje, učence in krajane, so bili tudi promocija za fiziko in tehniko.

DENSITY AND GIFTS IN PHYSICS LESSON
/
GOSTOTA SNOVI IN DARILA PRI FIZIKI

Dušanka Colnar

OŠ Frana Kocbeka Gornji Grad

dusanka.colnar@gmail.com

ABSTRACT

Density is a concept that is easier to grasp if students use their own experience from everyday objects, comparing properties such as mass and volume. The aim of this abstract is to explain how the topic was presented in a double lesson, where students explored blocks that have the same volumes but are of different mass. The main purpose of the research was for students to, explore how different materials with different densities can be analysed to accurately predict which of the known samples could be inside the gift. This was achieved by comparing observations and measurements taken from sample blocks of Iron, Aluminium and Brass.

Keywords: *Research,exploration, density, validation*

UVOD

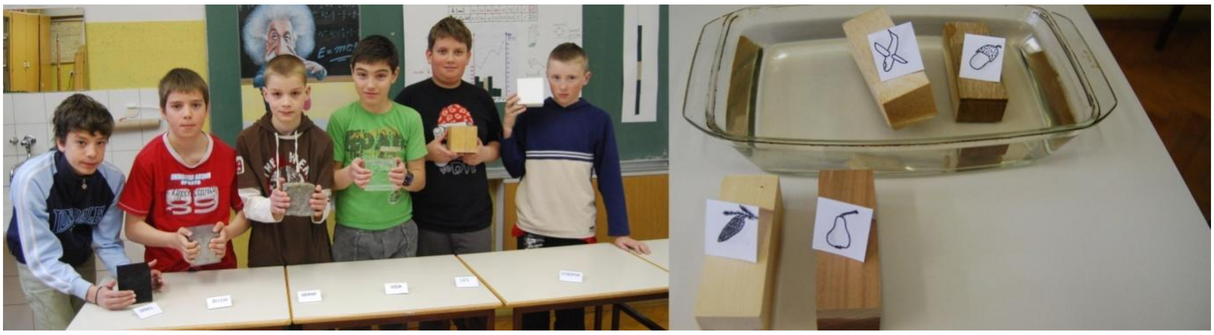
Gostota snovi je ena od fizikalnih količin, ki jih učenci spoznajo pri fiziki v 8. razredu. Učenci pojem gostote lažje osvojijo, če izhajajo iz konkretnih izkušenj, ki jih imajo s predmeti, z njihovimi masami in s prostorninami. Fleksibilni predmetnik nam omogoča različne načine organiziranja pouka. Zato sem lahko pri fiziki v 8. r. izvedla blok uro, ki je sledila učni uri, v kateri so se učenci spoznali s pojmom gostota snovi. Pri načrtovanju blok ure sem želela, da se z gostoto snovi učenci srečajo celostno, zato sem zasledovala tri skupine ciljev. V prvi skupini so bili cilji s področja fizike, v drugi skupini pa cilji s področja matematike. V tretji skupini so bili splošni cilji, ki so se navezovali na način dela, problemski pristop, postavljanje hipotez, raziskovanje, sodelovanje ter na razvijanje veščin in ročnih spretnosti.

METODA

Pouk je potekal v blok uri. Klasičnega frontalnega poučevanja je bilo zelo malo, le v začetku ure pri ponavljanju snovi prejšnje ure in v obliki navodil za delo. Večino časa so se skupine učencev ukvarjale z razreševanjem problema, povezanega z gostoto snovi. Postavili so hipotezo ter jo s pomočjo meritev in izračunov potrdili ali ovrgli. Pri tem so si učenci posamezne skupine delo razdelili, kar pomeni, da so morali med seboj sodelovati in komunicirati. Učenci so bili razdeljeni v sedem skupin. Dve skupini sta določali gostoto medenine, iz katere je izdelana ključavnica obešanka, ostalih pet skupin pa je moralo ugotoviti, v katerem od darilnih papirjev je zavit kvader iz aluminija, železa in medenine.

REZULTATI

Za začetek smo si ogledali 1 dm^3 velike kocke iz stiropora, lesa, vode, granita in železa. Razpravljali smo o njihovih prostorninah in masah ter jih razvrščali glede na gostoto. Vsako od kock so vzeli v roke in marsikateri učenec je bil presenečen, saj je železno kocko težko dvignil. Še bolj jih je, pa tudi vse odrasle, ki smo to preizkusili, dva tedna kasneje presenetila teža kocke, ki je vsebovala 1 dm^3 svinca. Prav tako so se na primerih enako velikih lesenih kvadrov (hrast, hruška, smreka, balsa) prepričali, da nimajo vse drevesne vrste lesa z enako gostoto, zato jih tudi uporabljamo za različne namene. Na spodnji sliki 1 levo vidimo enako velike kocke iz svinca, železa, granita, vode, lesa in stiropora, na sliki 1 desno pa kvadre enakih oblik iz različnih vrst lesa. Ti so za boljšo nazornost fotografirani v vodi.



Slika 1: Fotografija kock iz različnih materialov – levo in fotografija kosov lesa v vodi – desno.

Sledilo je delo v skupinah – trojicah. Dve skupini sta dobili vsaka tri, po velikosti različne ključavnice obešanke, kot je vidno na sliki 2 levo spodaj. Najprej so postavili hipotezo, iz katere snovi so izdelane. Nato so preverjali pravilnost hipoteze. S potapljanjem ključavnic v vodo so izmerili njihove prostornine in s tehtanjem še njihove mase. Gostoto so računali po obrazcu, ki smo ga spoznali prejšnji dan, s pomočjo tabel pa so ugotovili, da so ključavnice izdelane iz medenine. V teh dveh skupinah so bili sposobnejši učenci, ki so rešili še dve računski nalogi. Izračunali so, najmanj koliko cm^3 odpadka bi dobili, če bi iz ključavnice izrezali kvader in koliko % prostornine ključavnice bi predstavljal ta odpadek.

Učenci ostalih skupin so dobili kvadre iz aluminija, železa in medenine, zavite kot darila, kot je vidno na sliki 2 desno spodaj. Razvrščali so jih glede na maso in nato brez merjenja in računanja ugibali, katero od naštetih snovi jim je učiteljica zavila v kateri darilni papir. Sledilo je ugotavljanje pravilnosti postavljenih hipotez. Izmerili so dolžine robov kvadrov in njihove mase ter izračunali gostote. Svoje izračune so primerjali s podatki v tabelah gostot. S tem so potrdili ali ovrgli svojo hipotezo. Pravilnost svojih trditev so preverili še z odvijanjem zavitkov, saj so v njih našli zapisana imena snovi, iz katerih so kvadri. Kvadre so nato pazljivo zavili nazaj v darilni papir in napeljali okrasni trakec.

Slika 2: Fotografija ključavnic – levo in fotografija daril – desno.

Na koncu so poročali o svojih ugotovitvah in komentirali najzanimivejša spoznanja ter napake, ki so jih naredili. Za poročanje so se skupine preoblikovale, tako da je ena poročala o železu, druga o aluminiju in tretja o medenini, četrta je narisala plakat in peta pripravila kratek prispevek za šolsko spletno stran.

ZAKLJUČEK

Učenci so bili obe uri aktivni. Bili so veseli svojih, na podlagi opazovanj oblikovanih sklepov. Težko so postavljali hipoteze, še težje jim je bilo komentirati hipotezo, ki ni bila potrjena kot pravilna. Mislili so, da morajo biti vsa njihova predvidevanja vedno pravilna. Po končani uri so drugim učencem povedali, da neznana snov ni zlato, ampak medenina, in katera od deklic ni mogla dvigniti kocke železa. Nekatera spoznanja so jih presenetila, npr. da so med vrstami lesa takšne razlike in da obstaja lahek les, kot je balsa. Mene pa je presenetilo, da je le peščica učencev prepoznala medenino, da nekateri niso ločili med aluminijem in železom ter da je bilo zavijanje kvadra nazaj v darilni papir za mnoge zelo zahtevno opravilo. Učne ure, kjer bodo učenci pridobivali tako veščine kot druga spoznanja, so nujno potrebne. Z medpredmetnim povezovanjem jih lažje in učinkoviteje izvedemo.

DOES THE MODEL ASSEMBLY AT CHEMISTRY LESSONS CONTRIBUTE SIGNIFICANTLY TO UNDERSTANDING THOSE GROUPS OF PUPILS WHO ARE LESS SUCCESSFUL LEARNERS?
/
ALI SESTAVLJANJE MODELOV PRI POUKU BISTVENO PRIPOMORE K RAZUMEVANJU TISTIH SKUPIN UČENCEV, KI SO SICER MANJ UČNO USPEŠNI?

Matejka Černe

OŠ Solkan

matejka.cerne@guest.arnes.si

ABSTRACT

The research was conducted in three classes of the 9th grade primary school using / employing three different teaching approaches. In the first class pupils learnt in groups using the models; in the second class the teacher conducted the lesson frontally without the use of the models; and in the third class the combination of frontal teaching and ICT (computer animations) was employed. Although the results of the examinations (written tests and oral examinations) did not show significant differences in the knowledge of most pupils with average and above average grades at chemistry, the assembly models proved helpful for those pupils who are less successful (i.e. have on average lower grades). The use of models is essential in the implementation of differentiation (individualization) in classes where pupils need to be offered different teaching aids.

Keywords: *use of models for learning chemistry, understanding chemistry, quality of knowledge.*

UVOD

Za uspešno učenje kemije v osnovni šoli in boljšo kakovost znanja se pri ponazarjanju prostorske zgradbe snovi ali kemijskih reakcij pri pouku kemije posebno priporoča uporaba vizualizacijskih elementov, kot so modeli atomov in molekul ter računalniške animacije. Ti elementi imajo ključno vlogo pri razumevanju naravoslovnih pojmov in zakonitosti submikroskopskega sveta, saj omogočajo postopen prehod od makro ravni preko submikro do simbolne ravni.

METODA

Prvotni namen raziskave je bil ugotoviti, kolikšna je razlika v znanju učencev, ki so se učili z modeli in učenci, ki so se učili brez modelov.

Raziskava je potekala z učenci 9. razredov pri obravnavi vsebinskega sklopa kisikove organske spojine (zgradba kisikovih organskih spojin in reakcije nastanka kisikovih organskih spojin). Učenje je potekalo vzporedno v treh oddelkih s tremi različnimi didaktičnimi pristopi. V prvem oddelku so se učenci učili v skupinah z uporabo modelov (v nadaljevanju oddelek »modeli«), v drugem oddelku je potekal pouk frontalno z učiteljevo razlago in brez uporabe modelov (v nadaljevanju oddelek »frontalna«), v tretjem pa s kombinacijo frontalnega pouka z učiteljevo razlago ob uporabi modelov in uporabo IKT (v nadaljevanju skupina »frontalna +IKT«).

Oddelek »modeli« so imeli ves čas obravnave na voljo modele. In sicer vsaka skupina 1kpl, pri utrjevanju pa učenci z oceno zadostno pri kemiji, individualno vsak svoj komplet modelov.

Oddelek »frontalna« je obravnavo imel popolnoma brez modelov, skupina frontalna + IKT pa je modele sestavljala samo učiteljica demonstrativno, pri uporabi IKT pa je vsak učenec imel na voljo svoj računalnik in v svojem tempu reševal naloge testov na spletni strani Keminfa z naslovom »Uporaba molekulskih modelov pri poučevanju in učenju kemije« © NTF-KII, verzija 2008 ter Kemijski vizualizacijski test (Ferk; 2000).

REZULTATI

Rezultati preverjanj, tako pisnih kot ustnih niso pokazali bistvenih razlik v znanju učno uspešnejših učencev, ne glede na didaktični pristop pri obravnavi ciljev.

Razlika v razumevanju se je pokazala pri učno manj uspešnih učencih. Učenci, ki so imeli možnost sestavljati modele, so se bolje izkazali pri reševanju nalog, ki so vključevale slike modelov spojin, od učencev, ki modelov niso imeli možnost sestavljati. Pri ustnem ocenjevanju je bilo vsem učencem v vseh treh oddelkih ponujeno, da lahko uporabijo modele. To možnosti so izkoristili učno manj uspešni učenci iz oddelka, ki je usvajal kisikove organske spojine ob sestavljanju modelov. Ti učenci so z uporabo modelov naloge uspešno rešili in dobili boljšo oceno kot je sicer njihova povprečna ustna ocena pri kemiji. Učenci tega oddelka, ki dosegajo povprečne in nadpovprečne rezultate (ocene) pri pouku kemije, so brez težav rešili naloge pri ustnem ocenjevanju brez uporabe modelov. Prav tako so le redki učenci iz ostalih dveh oddelkov, ki niso samostojno sestavljali modelov ob obravnavi snovi, posegli po ponujenih modelih pri ustnem ocenjevanju.

ZAKLJUČEK

Učencem je potrebno ponuditi v procesu učenja različne učne pristope in različne učne pripomočke. Med pomembne vizualizacijske pripomočke zagotovo sodijo modeli vseh vrst in računalniške animacije. Z raziskavo sem ugotovila, da je sestavljanje modelov pri pouku kemije velikega pomena predvsem za tiste učence, ki so sicer učno manj uspešni. Samostojna uporaba modelov vpliva na boljšo predstavnost in razumevanje, spodbuja učenčevo aktivnost in podaljša čas zbranosti.

V nadaljevanju raziskave bi bilo smiselno ponovno preveriti znanje učencev in preveriti morebitne razlike v kakovosti in trajnosti znanja učencev čez določeno časovno obdobje.

ABSTRACT

We live in a time characterized, among other things, by rapid advances in gene technology, genomics and biotechnology. These disciplines have undoubtedly brought many benefits to our lives but they also raise numerous ethical, environmental and social questions. Not much research has been done so far in Slovenia systematically to explore public perception towards biotechnological issues. In particular, little is known about the attitudes of young generations that will be mostly affected by this technology in the future. To fill this gap, a comprehensive survey was conducted in the 2006/07 school year among 16 to 17 year old high school students. Altogether, 469 students from different Slovenian regions participated in the study. We wanted to examine how students assess four selected biotechnological examples: Bt corn, genetically modified salmon, somatic- and germ-line gene therapy.

Keywords: *biotechnology, usefulness, moral acceptability, risk, high students, attitudes*

UVOD

V Sloveniji do sedaj ni bilo izvedenih prav veliko raziskav, ki bi preučevale stališča širše javnosti do biotehnoloških vsebin. Sploh pa ne med mladimi, na katere bo imela omenjena tehnologija nedvomno največji vpliv. Da bi zapolnili vrzel tovrstnega preučevanja med mladostniki, starimi med 16 in 17 let, smo v šolskem letu 2006/07 opravili raziskavo, v kateri je sodelovalo 469 dijakov oziroma 8,4% vseh slovenskih tretješolcev gimnazijskega programa z osrednjeslovenske (ljubljanske), gorenjske, notranjske, štajerske in dolenjske regije. Zanimalo nas je, kako posamezni dejavniki kot so znanje in razumevanje molekularne in človeške genetike, spol dijakov, teža etične dileme, področje genske tehnologije in vrsta organizma, ki ga gensko spreminjamo, vplivajo na presojanje genske tehnologije z vidika uporabnosti, etično moralnega vidika in stopnje tveganosti.

METODA

Ker do leta 2008/09 učni načrt za biologijo za tretješolce ni vključeval biotehnoloških vsebin, smo jim le-te na kratko predstavili v obliki predavanja, podprtega z elektronskimi prosojnicami, in kratkim odlomkom iz dokumentarnega filma. V raziskavo smo vključili štiri biotehnološke primere s področja kmetijstva in medicine: gensko spremenjeno Bt koruzo, gensko spremenjene (GS) losose ter somatsko in zarodno gensko zdravljenje (GZ) hemofilije. Potrebno je poudariti, da so bili izbrani biotehnološki primeri dijakom predstavljeni tako, da so bile izpostavljene tako njihove prednosti kot tudi morebitna tveganja na račun zdravja potrošnikov in posegov v organizme oz. širše okolje ter etični pomisleki. Dijaki so presojali sprejemljivost vsakega od omenjenih primerov z vidika uporabnosti, etične sprejemljivosti in tveganosti s pomočjo petstopenjske lestvice strinjanja "nikakor ne – malo – srednje – precej – popolnoma". Pri vsakem vprašanju pa so napisali še utemeljitev svojega mnenja.

REZULTATI

Na podlagi rešenih vprašalnikov smo izdelali kvantitativno in kvalitativno analizo. Ugotovili smo, da so dijaki presojali Bt koruzo kot najbolj uporabno in najmanj tvegano. Kvalitativna analiza je pokazala, da so dijaki relativno visoko ocenili uporabnost Bt koruze na račun večjega pridelka in manjše škode za okolje v primerjavi z uporabo pesticidov. Ocene uporabnosti in moralne sprejemljivosti Bt koruze so bile zelo podobne ocenam somatskega GZ, GS losose in zarodno GZ pa so dijaki vrednotili podobno vendar z bistveno nižjimi ocenami od prej omenjenih aplikacij. Na podlagi kvalitativne analize smo ugotovili, da imajo dijaki bistveno več etičnih zadržkov v zvezi z zarodnim kot somatskim GZ. Med utemeljitvami so izpostavljali, da se jim ne zdi moralno sprejemljivo, da starši odločajo o usodi svojih potomcev. Statistično značilne razlike po spolu smo ugotovili v primeru zarodnega GZ in GS lososov. Dekleta so v primerjavi s fanti nižje ocenila uporabnost zarodnega GZ in GS lososov. Dekletom se je zdelo gensko spreminjanje lososov etično manj sprejemljivo kot fantom. Prav tako so dekleta v primerjavi s fanti zaznavala večjo tveganost v zvezi z zarodnim in somatskim GZ. Ugotovili smo, da je pri dekletih znanje molekularne in človeške genetike imelo večji vpliv na presojanje biotehnoloških primerov kot pri fantih. S kvalitativno analizo stališč dijakov v zvezi z etično-moralnim presojanjem smo v vseh štirih primerih zasledili pojavljanje tako vzorcev racionalističnega (deontološko in teleološko) kot tudi intuitivnega utemeljevanja. Le v primeru GS lososov se je pojavil tudi vzorec čustvenega utemeljevanja. Naša raziskava je potrdila povezavo med težavnostjo etične dileme, kot so jo zaznali strokovnjaki in uporabnostjo biotehnoloških primerov, ki so jo ocenjevali dijaki. Primera zarodnega GZ in GS lososov, ki so ju strokovnjaki ocenili kot etično najbolj težavna, so dijaki presojali kot najmanj uporabna. Po drugi strani pa so dijaki somatsko GZ in Bt koruzo ocenili kot najbolj uporabno, strokovnjaki pa kot etično manj težavna primera.

ZAKLJUČEK

Po odzivnosti dijakov med samo študijo lahko sklepamo, da so bili dokaj motivirani za razpravljanje o biotehnoloških primerih. Upamo, da bo naša raziskava spodbudila vključevanje družbeno naravoslovnih tem v šolsko prakso, saj to zagotovo lahko vodi do boljšega promoviranja naravoslovne pismenosti. Poleg tega pa naj bi omenjene tematike spodbujale tako intelektualni kot tudi moralni in socialni razvoj učencev.

ABSTRACT

Geometry is an inexhaustible source of mathematical notions and ideas. It is an ideal field for cross-curricular connection and search for similarities in everyday life. This paper presents the work in the 8th grade on the topic of polygons. The stress is on group work, classification and argumentation. The pupils presented their ideas and made a final report. While working, they integrated knowledge from various fields into one whole. In order to make a polygon, one has to use spatial perception, accuracy, persistence and orderliness. These skills can be gained during Mathematics, Design and Technology and Art and Design classes.

Keywords: *polygons, cross-curricular connection*

UVOD

Geometrija je neizčrpen vir matematičnih pojmov in idej, idealno področje za medpredmetno povezovanje ter za iskanje podobnosti v vsakdanjem življenju. Eden glavnih ciljev učitelja je učencem pomagati razviti njihovo zmožnost, da uporabljajo matematično znanje pri reševanju problemov. Želja učitelja je tudi, da bi učenci pridobili pozitiven odnos do matematike, da se je ne bi bali ter da bi z večjim veseljem reševali nove probleme.

Kitajska modrost pravi: kar sem slišal, sem pozabil; kar sem videl, sem si zapomnil; kar sem delal, sem se naučil. Zato je treba učence spodbuditi k ustvarjalnemu razmišljanju, raziskovanju, predvsem pa k samostojnemu odkrivanju znanja. Probleme, ki jim zastavimo, naj bi znali analizirati in oblikovati ustrezne ugotovitve.

METODA

V prispevku bom predstavila delo v 8. razredu v okviru ur aktivnosti na temo Večkotniki. Pri teh urah učenci s svojim matematičnim in drugim znanjem kompleksno obdelajo matematične ali ne matematične vsebine. Pri tem je poudarek na delu v skupini (dogovarjanje, razdelitev dela, koordinacija, komuniciranje), na klasificiranju in utemeljevanju, nadalje na predstavitvi svojih zamisli in na izdelavi poročila. Ob izvajanju dejavnosti učenci povezujejo znanja različnih področij v celoto.

V skupinah so s pomočjo različnega materiala ugotavljali, kaj so večkotniki in kje jih dobimo v vsakdanjem življenju.

Slike 1- 5: Večkotniki, ki jih uporabljamo v vsakdanjem življenju

S pomočjo Geo plošče so spoznali vrste večkotnikov in njihove lastnosti. S preiskovanjem (risanje, rezanje, lepljenje, sistematično zapisovanje ugotovitev ...) so raziskali diagonale, središčni kot, vsoto notranjih in zunanjih kotov.

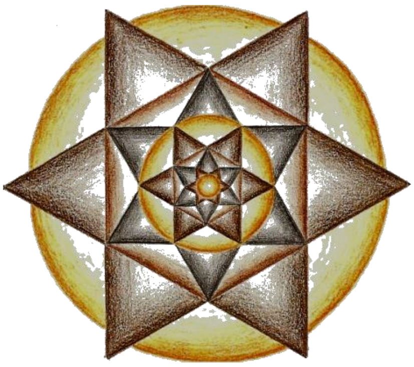
S pomočjo slik in fotografij različnih rastlin in živali ter drugih sestavin iz narave so ponovili simetrije, ki so jih obdelali v 7. razredu. Na vsaki sliki so narisali vse simetrije, jih poimenovali in ponovili njihove lastnosti. Pri biologiji so rastline in živali razvrščali v sisteme.

Slika 6 - 9: Simetrije v naravi

Spoznali so pravilne večkotnike, njihove lastnosti ter načrtovanje. Konstruiranje večkotnikov zahteva od posameznika uporabo prostorske predstave, veliko natančnosti, vztrajnosti pa tudi urejenosti. Te spretnosti lahko z vajo pridobivajo tako pri matematiki, tehniki in tehnologiji in likovni vzgoji.

REZULTATI

Učenci so s pomočjo preprostega raziskovanja spoznali celotno poglavje Večkotniki, s pomočjo slik in fotografij iz narave so ponovili in utrdili simetrije in z njihovo pomočjo načrtovali pravilne večkotnike. Pri tem so nastali številni izdelki, ki so jih še likovno opremili. Sledila je razstava in izdelava voščilnic z vzorci večkotnikov.



Slika 10: Izdelek učenke

ZAKLJUČEK

Tak način dela zahteva od učitelja drugačno in časovno obsežnejšo pripravo zaradi iskanja različnega gradiva. Predvsem pa mora paziti, da ne ostane samo na površnem prikazovanju matematike. Pri samem usvajanju snovi je koordinator in voditelj, učenci so glavni akterji, zato so zelo motivirani za delo, ki od njih zahteva veliko medsebojnega sodelovanja, aktivnega dela, povezovanja različnih znanj pa tudi individualno in samostojno delo. Učenci so bili navdušeni nad izdelki, ki so nastali z načrtovanjem različnih večkotnikov. Te ure so bile izpeljane v prednovoletnem času, ki je zelo primeren za izvajanje takih dejavnosti.

HOW TO MAKE TECHNOLOGY INTERESTING TO PUPILS?
/
KAKO PRI OSNOVNOŠOLCIH VZBUDITI ZANIMANJE ZA TEHNIKO?

Ivan Dović

OŠ Brinje Grosuplje

ivo.dovic@gmail.com

ABSTRACT

In this presentation I will talk about my idea of making technology interesting to pupils aged between 11 and 14. During my lessons I encourage pupils to gain knowledge through their own experience; therefore I always organize work according to the project learning method. I make sure that projects are interesting and entertaining to pupils and I try to include the largest possible number of aims, determined by the national curriculum. Such working method has proved to be successful- in school year 2009/2010 approximately 20% of pupils applied for model making class as one of extra-curricular activities at our school and 25% of pupils in the Years 7, 8 and 9 decided to take elective technology subjects. I will present two projects realised during the lessons of Design and Technology in Year 7 and model making class.

Keywords: *project learning method, curriculum, aims, electric car, eco speed boat, plastic, composite materials, fibreglass, electric motor.*

UVOD

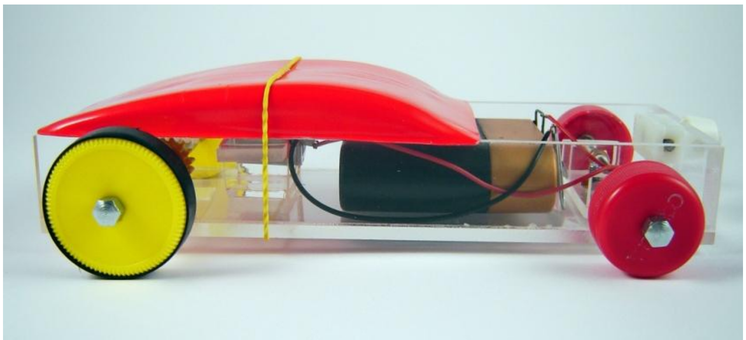
V prispevku bom predstavil izdelek, ki ga v 7. razredu osnovne šole izdelujemo pri predmetu Tehnika in tehnologija. Izdelek je zasnovan tako, da se ob njegovi izdelavi učenci srečajo s čim več vsebinami predpisanimi z učnim načrtom in preko lastne izkušnje usvajajo učne cilje. V nadaljevanju pa bom opisal primer projektnega dela pri interesni dejavnosti (modelarskem krožku). Z učenci smo zasnovali in izdelali 3,5 metra dolg gliser z električnim pogonom.

METODA

Izdelava električnega avtomobilčka iz umetne mase

Električni avtomobilček (Slika 1) sem zasnoval na podlagi učnih ciljev in vsebin, ki prevladujejo v tem razredu. To so umetne mase, elektrika, mehanizmi za prenos gibanj, računalniško krmiljenje in pravokotna projekcija oz. tehnično risanje. Karoserija avtomobilčka je izdelana iz umetnih mas. Med njeno izdelavo učenci spoznajo osnovne obdelovalne postopke umetnih mas kot so žaganje, brušenje, vrtanje, pa tudi nekoliko bolj zahtevne kot so termično preoblikovanje in globoki vlek. Avtomobilček poganja električni motor, ki ga morajo učenci pravilno zvezati v sklenjen električni krog s stikalom in virom el. napetosti. Izdelati morajo prenos gibanja od motorja na pogonski kolesi, kar storijo s polžastim in valjastim zobnikom. Tehnično dokumentacijo izdelamo s pomočjo računalnika. Avtomobilček je izdelek, katerega izdelava skoraj v celoti pokrije cilje in vsebine določene z učnim načrtom.

Na koncu leta med glavnim odmorom v šolski avli obvezno priredimo še zabavno tekmovanje avtomobilčkov.



Slika 1: Električni avtomobilček

Izdelava 3,5 metra dolgega električnega gliserja na modelarskem krožku

V devetih letih mojega poučevanja smo na šoli vzpostavili tradicijo nekoliko večjih projektov, ki se jih lotevamo na modelarskem krožku. Po uspešni izdelavi trimetrske jadrnice, dvo in pol metrskega Space Shutlla in pravega električnega avtomobila, smo kot zadnjega po dveh letih dela dokončali tri in pol metrski gliser z električnim pogonom (Slika 2). Idejo za njegovo izdelavo so dali učenci, saj so se v prejšnjih letih v šolski jadrnici naveličali čakati na ugoden veter. Skupaj smo poiskali način gradnje gliserja, ki bi mu bili kos tudi osnovnošolci in ki bi prinesel otipljive rezultate v relativno kratkem času, ki smo ga imeli na voljo. Odločili smo se za izdelavo gliserja iz vezane plošče oblečenega v poliestrsko smolo in stekleno tkanino. Med njegovo izdelavo so učenci spoznali veliko novih obdelovalnih postopkov lesa (delo z električno vbodno žago, električnim obličem, upogibanje vlažnega lesa….), delo s kompozitnimi materiali (poliestrska smola in steklena tkanina), obdelave kovin (delo na stružnici za kovine), vgradnja mehanskih sklopov (pogonska gred motorja, krmilni mehanizem…), vgradnja in vezava elektromotorja z elektronskim krmilnikom vrtljajev…

REZULTATI

Ob izdelavi električnega avtomobilčka učenci v sproščenem vzdušju usvajajo zastavljene cilje. Avtomobilček so učenci zelo dobro sprejeli in ga z veseljem izdelujejo ter izboljšujejo tudi v prostem času. Med izdelavo gliserja smo se ogromno naučili tako učenci kot tudi jaz. Vsi smo bili zelo visoko motivirani za delo, v delavnici smo ostajali po pouku, in v šolo prihajali tudi med počitnicami. Za svoje delo smo bili nagrajeni z uspešno javno splovitvijo in z zlatim priznanjem na tekmovanju mladih tehnikov.

Slika 2: Gliser z električnim pogonom

ZAKLJUČEK

Rezultat metode dela, ki upam da ja razvidna iz tega kratkega prispevka, je izjemno zanimanje otrok za tehniko na naši ne ravno veliki šoli. To se lepo vidi pri modelarskem krožku, ki ga v dveh skupinah obiskuje skoraj 40 otrok in pri izbirnih predmetih. S področja tehnike smo letos imeli štiri izbirne premete, ki jih je obiskovalo preko 60 otrok. Menim, da v danih razmerah poslanstvo osnovnošolskega učitelja ni zgolj v tem, da učencem posreduje določena znanja, ki so v današnjem času pogosto že zastarela, pač pa v tem, da učencem omogoči, da se preko lastne izkušnje srečajo s številnimi področji znotraj tehnike in tehnologije in jih poizkusi navdušiti za katero izmed njih. V kolikor učitelju to uspe, mora biti sposoben učenca usmerjati v iskanje nadaljnjih informacij in znanj s tega področja in zaupati, da bo učenec, ki ga zanima določeno področje s časoma to znanje tudi osvojil in ga nadgradil.

Več fotografij o električnem avtomobilu in EKO gliserju ter informacij o mojem delu nasploh je na voljo na spletnem naslovu: http://www2.arnes.si/~idovic

ABSTRACT

Changes in our environment and society require a well-educated scientists who know how to take meaningful decisions about it. Therefore, we at Šolski center Novo mesto set an ambitious four-year project Energy as a value, whose aim is to enhance students' science literacy. In the first part of the project, 93 students in the first year explored and analyzed domestic consumption of electricity and find opportunities for more rational use of energy. Each student has created a 30-40 pages project report, which is detailed and systematically presents their research findings.

Keywords: *domestic energy consumption, project work*

UVOD

Človeštvo se v 21. stoletju razvija hitreje kot kdajkoli prej in izzivi, katere prihodnost prinaša, se ne dotikajo le strokovnjakov, ampak tudi navadnih ljudi in njihovih življenjskih situacij. Ti izzivi so povezani s čedalje večjo globalizacijo, hitrim tehnološkim razvojem in posledičnimi zahtevami za kompetencami, kot so kreativnost, fleksibilnost, sposobnost za timsko delo in kompetence na področju IKT. Med omenjene izzive sodijo globalno segrevanje, trajnostni razvoj ter smotrno ravnanje z energijo in energetskimi viri. Naloga pouka fizike in naravoslovnih ved nasploh je, da dijake nauči naravoslovne pismenosti. Biti naravoslovno pismen ne pomeni le, da poznamo osnovne koncepte, zakone in metode naravoslovja, ampak pomeni tudi, da smo sposobni to znanje združiti z znanji z drugih področij, ga združiti z osebnimi prepričanji in vrednotami ter ga uporabiti v vsakdanjem življenju. Le naravoslovno pismen človek ve, kako se argumentirano odločati v primerih, ki zadevajo naravoslovje, kot so na primer energijska poraba, okoljevarstvena politika, globalno segrevanje ali genetski inženiring.

Projekt *Energija kot vrednota* je na Srednji elektro šoli in tehniški gimnaziji na Šolskem centru Novo mesto zastavljen kot razvojni projekt, pri katerem se učitelji usposabljajo za timsko, sodelovalno in interdisciplinarno poučevanje, pri dijakih se pa krepi naravoslovna pismenost in se jim tako ponudi čvrsta podlaga za individualno odgovorno in globalno solidarno življenje*.*

Energija kot vrednota je štiriletni projekt, pri čemer v vsakem letniku izvedemo en sklop. Prvi sklop, ki smo ga izvedli v šolskem letu 2008/2009, je imel naslov *Racionalna raba energije doma* in v njem so sodelovali dijaki treh oddelkov prvega letnika tehniške gimnazije, to je 93 dijakov. V šolskem letu 2009/2010 izvajamo sklop *Energijske spremembe*, v šolskem letu

2010/2011 bomo nadaljevali s sklopom *Zmanjševanje porabe in povečanje energetske učinkovitosti*, štiriletni projekt pa bomo zaključili s sklopom *Globalna energetska prihodnost*.

Primarna naloga prvega sklopa *Racionalna raba energije doma* je bila priprava aktivnosti, pri katerih bi dijaki ugotavljali pomen učinkovitega in racionalnega gospodarjenja z energijo. V ta namen je 14 učiteljev sodelujočih predmetov v projektu – fizike, matematike, informatike, slovenščine in tujega jezika – izdelalo skupen načrt izpeljave teh aktivnosti, pri čemer so celotno delo koordinirali in vodili učitelji fizike, ki je bila temeljni predmet, ostali predmeti pa so odigrali vlogo podpornih predmetov.

METODA

Glavni del sklopa je bilo raziskovalno delo dijakov o porabi električne energije pri njih doma. Tako so od novembra 2008 do marca 2009 dvakrat dnevno beležili porabo električne energije v svojih gospodinjstvih. Na podlagi dobljenih rezultatov so dijaki izdelali obsežno poročilo, ki je zajemalo od 30 do 40 strani in v katerem so natančno predstavili porabo električne energije v njihovem gospodinjstvu ter podali smernice za bolj smotrno izrabljanje energije. V prvem delu naloge so dijaki spremljali dnevna, tedenska ter mesečna nihanja porabe električne energije in iskali vzroke za ta nihanja. Poleg tega so za vsak teden natančno analizirali porabo električne energije na družinskega člana ter porabo na vsak kvadratni meter uporabne površine. Vse meritve in izračune so ustrezno predstavili v obliki tabel in grafikonov. V drugem delu naloge so analizirali, koliko električne energije mesečno porabi posamezen električni porabnik v hiši ter dobljene podatke sistematično predstavili v tabelarični obliki.

Ker smo želeli dobiti povratne informacije o izvedbi projekta, so v poročilih bila dodana tudi mnenja in predlogi dijakov in staršev. Po analizi zapisanih mnenj smo ugotovili, da si tako dijaki kot tudi starši kljub obsežnosti izvedene raziskave želijo več takih projektov, ki ne le, da pri dijakih razvijajo kompetence, potrebne za njihovo nadaljnje izobraževanje in življenje, ampak tudi pokažejo, na katerih področjih lahko posamezna družina racionalizira porabo energije in s tem doda svoj kamenček v mozaik bolj učinkovitega ravnanja z energijo. Izdelana poročila smo učitelji pregledali in na podlagi doseženih ciljev, katere smo s projektom želeli doseči, pri vključenih predmetih dijake tudi ocenili.

REZULTATI

Glavni rezultat prvega sklopa predstavlja 93 poročil posameznih dijakov, v katerih so natančno opisali postopek dela na projektu ter sistematično in pregledno predstavili vse svoje ugotovitve v zvezi z porabo električne energije v njihovim domovih. Obvezni del vsakega poročila predstavljajo tudi mnenja dijakov in staršev o projektu ter vpliv ugotovitev projekta na racionalnejšo porabo električne energije.

V vsakem od treh sodelujočih razredov so dijaki iz posameznih poročil naredili tri skupna poročila, ki so obravnavala tri različne tipe bivališč – stanovanja, mestne hiše in hiše na podeželju. Na ta način smo dobili še natančnejše informacije o rabi električne energije, obenem pa so dijaki spoznavali tudi prednosti in zahteve timskega dela.

ZAKLJUČEK

Pozitivne izkušnje iz prvega sklopa projekta kažejo, da smo na pravi poti in da je projekt smiselno nastavljen, saj dijakom poleg razvoja ustreznih kompetenc omogoča, da svoja razmišljanja in ugotovitve o pridobivanju, uporabi in varčevanju energije dijake raznesejo tudi v svoje domove in širše življenjske skupnosti.

TEACHING SCIENCE IN ENGLISH
/
POUČEVANJE NARAVOSLOVJA V ANGLEŠČINI

Nataša Glodež

OŠ Voličina

natasa.glodez@guest.arnes.si

ABSTRACT

The article presents cross curricular activities from the area of teaching English through the subject of Science. English teachers teach Science and technology topics from the fourth grade where pupils learn simple vocabulary, whereas in higher grades they would develop skills like analysis, synthesis, and evaluation over the following topics: animal and plant world, inventions, environmental issues, findings in science and technology. To motivate pupils into doing research in science and technology, working on an international project like Comenius is a very good idea. Comenius helps teachers and students to step out of the classroom and demands from the teachers to be flexible, cooperative, and ready to learn new things. Our Comenius-school partnership is a science-language project. Humanistic and inquiry-oriented science teaching is a teaching method that engages students in solving problems in science as an integral part of learning English.

Keywords: *international projects, cross curricular activities, Comenius-school partnership.*

UVOD

Učenci že v času osnovnošolskega izobraževanja pričnejo prevzemati odgovornost za samostojno delo in manjšo odvisnost od učitelja. Zavedajo se, da je uspeh povezan s številnimi nejezikovnimi znanji in uspešnimi strategijami za samostojno učenje. Učence pripravljamo na vseživljenjsko učenje s pomočjo različnih vsebin in dejavnosti, za to pa so nujne medpredmetne povezave. Sam angleški jezik je sredstvo za navezovanje medosebnih odnosov in jezikovnih stikov v tujem svetu. Pomembno je, da je vsebinsko in težavnostno povezan z učenčevim spoznavnim razvojem. Tako se na primer tema 'Naravoslovje in tehnika' pojavlja od četrtega do devetega razreda, pri čemer gre v četrtem razredu za poimenovanje besedišča in tvorjenje preprostih povedi (kaj jim je všeč, kaj jim ni všeč), v višjih razredih pa razvijajo višje spoznavne sposobnosti: analizo, sintezo, vrednotenje, presojanje preko tem, kot so rastlinski in živalski svet, odkritja in izumi, neživa narava, skrb za okolje, dognanja v znanosti in tehniki.

Veliko motivacijsko prednost in medpredmetno povezovanje predstavljajo projekti, v katere se šole vključujejo. Od učiteljev se pričakuje fleksibilnost, pripravljenost na učenje, sodelovanje in timsko delo. Učitelji družboslovnih predmetov smo velikokrat v zadregi, kadar gre za projekte z naravoslovno ali tehniško vsebino. Ker velikokrat čutimo premalo usposobljenosti za sodelovanje, je pomembno, da pristopimo iz drugega zornega kota in razmislimo, kako lahko naravoslovne in tehniške vsebine vključimo v predmet, ki ga poučujemo. Pri tem je nujno potrebno poznavanje ciljev učnega načrta, na podlagi katerega pripravimo letno pripravo, ki zajema cilje posameznega projekta z naravoslovno in tehniško vsebino.

Projekt Comenius omogoča izstopiti iz konteksta učilnice. Poleg naravoslovnih vsebin učenci izboljšujejo znanje angleškega jezika, izvajajo medsebojno načrtovan naravoslovni raziskovalni projekt, organizirajo svoje delo in predstavijo rezultate. Projekt predstavlja tudi vprašanje jezikov v naravoslovju. Združevanje poučevanja jezikov in naravoslovja je zelo pogosto, vključevanje jezikovnih dejavnosti v poučevanje naravoslovja pa je za otroke tudi privlačnejše in spodbudnejše. Tak način poučevanja naravoslovja v povezavi s tujim jezikom bolje odraža izkušnjo naravoslovnih raziskovalcev kot sam pouk naravoslovja. Na OŠ Voličina smo sodelovali v raziskovalnem naravoslovno-jezikovnem projektu 'Kako rentgenski žarki vplivajo na rastlinsko rast'. Vsebinski del projekta je pripravil profesor iz Finske, ki je pripravil mapo s teoretičnim uvodom, navodili za delo in tabelami za vpisovanje rezultatov.

METODA

Delo v Comeniusu je zastavljeno projektno in od učiteljev zahteva veliko motivacije in predvsem želje po spoznavanju novega, zahtevnega in drugačnega. Lahko se preizkusijo v ustvarjanju idej in nove, dodane vrednosti, bogatejši so za nova strokovna in druga spoznanja ter za povsem življenjske izkušnje, ki jim jih ne more nihče več odtujiti. Potrebno je tudi ustrezno motivirati učence.

Metode, ki smo jih na naši šoli uporabili pri projektu: raziskovalno delo, neposredno opazovanje, praktično delo, delo z besedilom, samostojno delo. Učenci so urili spretnosti sklepanja, primerjanja, povzemanja in diskusije. Uporabili smo obliko dela v dvojicah. Uporabili smo semena redkvic, ki so bila izpostavljena različnim jakostim rentgenskih žarkov: 50Mrad, 150Mrad in 500Mrad. Rast smo primerjali s kontrolno skupino, ki žarkom ni bila izpostavljena. Potek dela: učenci so v dvojicah prebrali teoretični uvod, da bi se spoznali z vsebino in načinom dela. Seznanili so se z neznanim strokovnim besediščem. Neznane besede so samostojno poiskali v angleškem slovarju in se pogovarjali o pomenu posamezne besede. Sledil je razgovor v angleščini in učenci so na podlagi svojega že usvojenega znanja iz naravoslovja sklepali, kakšni bi lahko bili raziskovalni rezultati. Dogovorili smo se, kdaj bomo semena posadili, dvojice pa so pripravile seznam pripomočkov, ki jih morajo prinesti od doma (4 plastične lončke s podstavki, zemljo, alkoholni flomaster). Pred sajenjem so učenci izmerili pH zemlje, napolnili plastične lončke in v vsak lonček posadili 4 semena redkvic (vsako seme posebej in ne preveč globoko v zemljo) ter zalili. Na lončke so označili, kaj so posadili. Sledilo je 22 dnevno opazovanje rasti, beleženje rezultatov, primerjava rezultatov in dnevna diskusija o poteku. Na skupnem srečanju vseh držav partneric so učenci svoje rezultate predstavili in oblikovali skupno poročilo, ki je vsebovalo rezultate vseh sodelujočih.

REZULTATI

Rezultati so vsebovali beleženje števila vzklitja, velikost, število listov, umrljivost. Učencem je beleženje rezultatov vzelo petnajst minut dela na dan. Raziskovalni rezultati so pokazali razliko v rasti redkvic, izpostavljenim različnim jakostim rentgenskim žarkom. Najmanj izpostavljene se zrasle najvišje, največ izpostavljene pa so umrle. Učenci so razvijali svoje spretnosti na motivacijskem področju, kognitivnem in socialnem področju. Poleg vsebinskih raziskovalnih rezultatov smo ugotovili, da se je med učenci zelo povečalo sodelovanje, samostojnost, komunikacija in tekočnost angleščine z uporabo novega strokovnega besedišča. To smo ugotovili s preprosto metodo intervjuja. Izboljšale so se spretnosti analize, sinteze, abstrahiranja in diskusije. Izboljšanje teh spretnosti so ugotovili tudi drugi učitelji pri pouku.

ZAKLJUČEK

Ugotovili smo, da je sodelovanje v projektu Comenius-šolska partnerstva pozitivno vplival na spoznavni, motivacijski in socialni razvoj pri učencih. Neformalno sporazumevanje in timsko delo sta izboljšala odnose med učenci in učitelji. Sodelovanje v projektu je učencem omogočil splošen pregled nad šolami v drugih državah in nad načini, kako se učenci iz partnerskih šol soočajo s skupnimi nalogami. Ob tem so učenci razširili svoj angleški besedni zaklad s področja naravoslovja in izboljšali tekočnost angleščine.

ENERGY THROUGH DAYS OF ACTIVITIES / TEDEN NARAVOSLOVNIH DEJAVNOSTI

Alma Gregorič

OŠ Lucijana Bratkoviča Bratuša Renče

alma.gregoric@guest.arnes.si

ABSTRACT

In April 2009 a Primary School Renče carried out a week of natural science activities on the topic of »Energy« for students from sixth to ninth grade. In each class we have choise a substantive theme depending on the aims set out in the syllabus related to the issues of energy.

The emphasis was placed on experimental and research work; the designing and manufacturing of products as well as operation and applicability checking; problem-oriented and differentiated tasks. Because of inter-subjects plan of activities, beside reaching our aims at these natural science subjects, the aims in other subjects were realised as well. Children were very active throughout the entire process and have shown a lot of enthusiasm.

Keywords: *Natural science activities week.*

UVOD

Ko smo se pred nekaj leti na Osnovni šoli Lucijana Bratkoviča Bratuša vključili v projekt Fleksibilni predmetnik, nam je bila dana možnost strnjenih oblik poučevanja, več medpredmetnega povezovanja, pogostejše vključevanje aktivnih oblik dela, kar je za učence pomenilo zanimivejši pouk. V šolskem letu 2007/ 2008 smo izvedli teden dejavnosti, ki smo ga v lanskem šolskem letu še nadgradili. V tednu naravoslovnih dejavnosti so učenci od šestega do devetega razreda obravnavali energijo tako, da so izvajali dejavnosti pri različnih predmetih in tako tudi dosegali cilje, ki jih določajo učni načrti tako naravoslovnih kot tudi ostalih predmetov.

METODA

Učenci 6. razreda so v tednu naravoslovnih dejavnosti spoznavali elektriko, električni krog, električni tok ter iskali možnosti varčevanja električne energije. Sestavljali so električni krog, eksperimentalno ugotavljali, kaj vpliva na jakost električnega toka in kateri so največji porabniki električne energije v gospodinjstvu. Pri urah tehnike in tehnologiji so izdelali izdelek, ki je vključeval električni krog, pri gospodinjstvu so merili porabo električne energije različnih aparatov. Pri slovenščini so sestavili anketo, s katero so zbirali podatke o porabi in varčevanju električne energije. Zbrane podatke so pri matematiki obdelovali in razvrščali v tabele. Anketo so prevedli tudi v angleščino ter se naučili nekaj sloganov o varčevanju električne energije. Pri geografiji so se učili o elektrarnah, ki proizvajajo električno energijo. Ob koncu tedna so pri likovni vzgoji in slovenščini oblikovali zgibanko, s katero so predstavili dejavnosti celega tedna.

V 7. razredu je bila tema »Sonce je vir energije«. Obravnavali so pomen sončne svetlobe za fotosintezo. Načrtovali in izvedli so poskuse, s katerimi so dokazovali vpliv svetlobe na potek fotosinteze. Temo so nadgradili z naravoslovnim dnevom o gozdu, kjer pa so poleg pomena svetlobe in procesa fotosinteze obravnavali in določali drevesne vrste, grme v naših gozdovih, mahove, lišaje, pogostost pojavljanja lišajev ter vzroke za njihovo rast. v gozdu so spoznali tudi najpogostejše prebivalce: sesalce, ptiče, žuželke… V okviru geografije so obravnavali gozdove v drugih toplotnih pasovih. Zbirali so podatke o temperaturah in količini padavin v nekaj krajih ter za te kraje izdelali klimogram. Pri urah slovenščine in geografije so iskali povezavo med imeni drevesnih vrst in imeni krajev. S pomočjo virov so zbirali informacije o izkoriščanju sončne energije, izdelali so načrt za sončni kolektor in vsak učenec je po svojem načrtu sončni kolektor tudi izdelal ter preizkusil njegovo delovanje.

V 8. razredu so obravnavali goriva, gorenje ter problematiko izgorevanja fosilnih goriv. Pri kemiji so z eksperimentom spoznali lastnosti nekaterih goriv ter jih med sabo primerjali. Na osnovi simulacije efekta tople grede so spoznavali, da toplogredni plini vplivajo na segrevanje ozračja ter ugotavljali povezave s podnebnimi spremembami. To je bil vzrok, da so se z igro vlog pripravili in z argumenti zastopali svoja stališča na okrogli mizi o podnebnih spremembah. Z medpredmetno povezavo fizike, angleščine, likovne vzgoje ter tehnike in tehnologije pa so iskali možnosti izkoriščanja energije vetra ter kako s toplotnimi izolatorji zmanjšati izgube energije.

Učenci 9. razreda so obravnavali energijo skozi dve temi in sicer »Elektrika« ter »Hrana kot vir energije«. Pri elektriki so se posvetili obnovljivim virom energije: izdelovali so veternice, računali izkoristek energije vetra ter energijo sončne celice. V okviru tematike »Hrana kot vir energije« so učenci z medpredmetno povezavo in prepletanjem učnih ciljev in vsebin kemije in biologije spoznavali, kaj se dogaja s hrano po zaužitju. Tako so učenci istočasno obravnavali vsebine, ki so neločljivo povezane, kar jim je omogočalo lažje razumevanje procesa presnove v človeškem organizmu. Eksperimentalno so dokazovali hranilne snovi v različnih živilih ter snovi. Eksperimentalne vaje so bile diferencirane tako, da so učenci višjega nivoja imeli problemsko zasnovano nalogo z načrtovanjem in izvedbo eksperimenta, učenci nižjega nivoja pa so eksperimentalno nalogo izvajali po navodilih. Računali so vnos energije s hrano ter porabo energije pri različnih aktivnostih. Svoje ugotovitve so učenci predstavili na plakatih tako, da je bilo moč uvideti celotnost razumevanja obravnavanih vsebin. Pri jezikih so se devetošolci v tem tednu pripravili in z igro vlog izvedli okroglo mizo o (ne)zdravi prehrani mladostnikov.

REZULTATI

Čeprav ob zaključku tedna dejavnosti nismo sistematično vrednotili osvojenega znanja v tem tednu, menimo, da je takšno celostno učenje učinkovitejše, trajnejše, proces učenja pa za učence in učitelje zanimivejši. Ob koncu tedna so učenci v anketi izrazili svoje navdušenje nad tednom dejavnosti, predvsem zaradi aktivnega, razgibanega in zanimivega dela. Tudi učitelji smo ta teden ocenili zelo pozitivno, predvsem z vidika izjemne motiviranosti učencev za učenje. Pozitivno presenečeni smo bili nad dosežki učencev, ki se sicer soočajo z učnimi težavami.

ZAKLJUČEK

Organizacija takšnega tedna dejavnosti zahteva od učiteljev timsko načrtovanje, medsebojno usklajevanje in prilagajanje. Urnik je potrebno v celoti spremeniti in ga uskladiti glede na teme oz. zastavljene cilje po posameznih predmetih. Urnik smo imeli samo učitelji, medtem ko učence v tem tednu nismo seznanjali, kateri predmeti so na urniku. Sproti so bili obveščeni, kaj morajo prinesti naslednji dan k pouku in kakšne obveznosti imajo do naslednjega dne. Ker učenci teh zadolžitev niso dojemali kot »klasične« domače naloge, so svoje delo doma dobro opravili in redno prinašali v šolo vse potrebne pripomočke.

Četudi celostni, medpredmetno in problemsko naravnani pouk, zahteva od učiteljev veliko več priprav, smo bili učitelji enotnega mnenja, da dobri rezultati, motiviranost učencev ter izraženo zadovoljstvo učencev, učiteljev in staršev kažejo na to, da smo na pravi poti in je vredno tak način dela v bodoče nadgrajevati in širiti.

Zahvaliti se moramo pedagoškim svetovalcem iz Zavoda za šolstvo za strokovno pomoč, sodelovanje, nasvete in aktivno vključevanje v pedagoški proces.

ABSTRACT

The paper presents an example of project research work in the field of natural science. The project was carried out by second and fourth class pupils. This research project aims at involving pupils in terms of active support in order to resolve problems so as to make our planet safer and cleaner. The pupils found out that their support can be provided in many different ways: by reducing waste, choosing environment-friendly products, and nevertheless by fighting for a cleaner and greener future. They also found out that an enormours amount of fuel is burnt by cars, vans, planes and other means of transportations. In the future, what needs to be taken into consideration is to make use of biofuel so as to reduce the pollution. The pupils with the assistance of the tutor produced cars and other means of transportations that will use solar or electric energy instead of petrol or fossil fuels and thus they will be environment-friendlly means of transportations. While working, the pupils showed a great amount of interactional collaboration and help. While producing their products, the pupils showed their prior knowledge, they helped each other and shared their experiences.

Keywords: *pollution, a greener future, means of transportation, energy, natural science.*

UVOD

Moj glavni namen tega projekta je bil, da bi prav vsi učenci spoznali kako lahko vsaka družina privarčuje nekaj energije, če namesto avtomobila občasno uporablja druge oblike prevoza. Javni prevoz je lahko hiter, varen in manj škodljiv za naše okolje. Kdor potuje z javnimi prometnimi sredstvi kot so avtobusi, tramvaji in vlaki, povzroči do 100 krat manj onesnaženja kot tisti, ki se vozi sam v avtomobilu. Mnoga mesta uvajajo električne vlake, tramvaje in enotirne železnice, ki ne izpuščajo škodljivih plinov v zrak in ki povzročajo tudi manjše zvočno onesnaženje.

Učenci so od doma prinesli najrazličnejše revije, časopise, prospekte, knjige, vse na temo onesnaženi planet. Naloga učitelja je, da jih vodi, usmerja in spodbuja pri iskanju neznanega. Z uporabo razne literature in aktivnim sodelovanjem in vključevanjem učencev v različne dejavnosti učitelj pripelje učence do boljše naravoslovne pismenosti.

Z veliko motivacije in željo po iskanju različnih rešitev za izdelavo prevoznih sredstev okolju prijaznih, so se lotili dela in pri tem zelo uživali. Pri delu so razvijali tudi pozitivne medsebojne odnose in pozitivno samopodobo.

METODA

Z učenci smo se pogovarjali o prometu, prometnih sredstvih nekoč in danes. Ugotovili so, da so prvotni načini pogonov vozil temeljili na sili vetra, vodnega toka in človeških mišic, zato onesnaževanja ozračja skoraj ni bilo. V knjigah in literaturi, ki so jo imeli na razpolago so poiskali vire in spoznali, da je z razvojem človek začel uporabljati premog in les. Začeli so uporabljati nerodne parne lokomotive. Tako so tudi po železnicah lahko prevažali zelo težke tovore. Z vlaki so lahko povezovali vsa mesta. Število vozil v cestnem prometu je naraščalo. Vključno z iznajdbo kolesa z zračnico in kočij so začeli graditi gladke in bolj kvalitetne ceste. Najnovejšo obliko prevoznih sredstev pa je predstavljal zračni promet in sicer baloni, nato pa letala. Ta so zelo hitro izpodrinila in nadomestila potniške ladje. Nekoč le sanje, so postale resničnost. Letala so povzročila pravo revolucijo v prometu in pospešila razvoj znanosti. Sodobni sistem prometa je tako zapleten, da ga morajo nadzorovati avtomatsko. Pri tem pomagajo človeku računalniki, elektronska komunikacijska sredstva in zasloni pa tudi alarmni sistemi.

Prevozna sredstva v preteklosti niso onesnaževala okolja, zraka. Danes pa je naš planet v nevarnosti zaradi takih onesnaževalcev kot so prevozna sredstva.

Učenci so odgovarjali na zastavljena vprašanja v zvezi z onesnaževanjem okolja nekoč in danes. Narisali so prevozna sredstva nekoč in danes in jih izrezali ter prilepili na plakat. Nekateri učenci so sestavili rime in jih tudi zapisali. Prav vsak učenec si je iz odpadne embalaže izdelal prevozno sredstvo prijazno okolju, ki jih poganjajo snovi, ki ne povzročajo škode).

REZULTATI

Cilje, ki sem si jih zastavila, so bili realizirani. Skupaj z učenci smo načrtovali skico projektnega učnega dela, s katero smo si pomagali pri izvajanju projekta Med izdelovanjem skice so se učenci pogovarjali, izmenjavali ideje in mnenja ter dajali predloge za potek projekta. Literature na to temo smo imeli veliko, zato so se učenci veliko novega naučili. Ogledali smo si železniško postajo, pogovarjali s policistom, risali prevozna sredstva nekoč in danes. Poleg prevoznih sredstev so učenci našteli glavne onesnaževalce okolja, ki so že nevarni za naš planet. Te so tudi narisali: tovarne, onesnaževanje vode, nuklearno industrijo, jedrske elektrarne, gospodinjske kemikalije…

Učenci so spoznali, da nekatere onesnažujoče kemikalije imajo takojšnje učinke, nekateri najnevarnejši učinki pa prizadenejo naša telesa in duševnost. Kemikalije v zraku, vodi, živilih in pijačah ko pridejo v telo, povzročijo včasih trajno škodo.

Novo izrazoslovje je prispevalo k večji naravoslovni pismenosti vsakega posameznika.

ZAKLJUČEK

Učenci so s svojimi praktičnimi izdelki pokazali svoje ideje in znanja, ki so jih pridobili. Z analizo in primerjavo njihovih izdelkov smo ugotovili, da so uresničili zastavljene cilje. Izdelava prometnih sredstev je razvila pri učencih smisel za konstrukcijo, načrtovanje in gradnjo. Pri tem so učenci pridobivali nova spoznanja, izkušnje in predstave. Do izraza je prišla medsebojna pomoč, sodelovanje in dogovarjanje. Učenci so se med izdelovanjem dopolnjevali in izmenjavali izkušnje. Preko tehnike so spoznavali primeren odnos do dela in do drugih sošolcev. Razvijali so tudi moralne norme. Delo je potekalo v prijetnem vzdušju in končni izdelki so nam bili v velik ponos.

ABSTRACT

In the study preliminary results on the impact of students' motivational profiles and their knowledge gained through hands-on approach to visual spectroscopy, are presented. The modules were developed during the Leonardo da Vinci project »Hands-on Approach to Analytical Chemistry for Vocational Schools«, 2003-2005, while the evaluation study is a part of the ongoing project »Hands-on Approach to Analytical Chemistry for Vocational Schools II, 2008 – 2010, in which partners from the University of Bristol, UK, the University of Gdansk, Poland, and the University of Ljubljana are developing new experiments for transfer of innovations into vocational schools.

Keywords: *hands-on approach, visual spectroscopy, motivational profiles*

UVOD

Evropski Leonardo da Vinci projekt Prenosa inovacij z naslovom »Izkustveni pristop k analizni kemiji za strokovne šole II« združuje partnerje z Univerze v Ljubljani, Univerze v Bristolu in Univerze v Gdansku ter slovenske strokovne šole s področja živilstva, kemije in farmacije. Jedro prenosa inovacije je spektrometer Spektra^{TM}, ki je rezultat slovenskega znanja (Gros, 2004) in omogoča hitro in varno eksperimentiranje, z majhnimi količinami kemikalij. Podloge imenovane blistri, v katere v farmacevtski industriji pakirajo dražeje, služijo kot reakcijske in merilne komore. Spektrometer je enostavno mogoče nadgraditi v druge analizne instrumente, kot sta na primer plinski in tekočinski kromatograf. Projektni partnerji razvijajo eksperimente za izkustveno učenje zelo različnih strokovnih in naravoslovnih vsebin ter jih objavljajo na spletni strani projekta (http://www.kii2.ntf.uni-lj.si/analchemvoc2/file.php/1/HTML/slo/default.htm). Doslej je bilo razvitih približno 50 eksperimentov. Eksperimenti so s področja svetlobe in barv, analize vod in zemlje, analize živilskih proizvodov in pijač, biotehnologije, analize materialov, kemijskega ravnotežja in kinetike, kromatografije ter naravoslovja. Strokovne šole uvajajo in preverjajo učno enoto »Izkustveni pristop k spektrometriji v vidnem področju« s svojimi dijaki. Ob tem izvajamo sistematično evalvacijsko študijo, ki vrednoti vpliv takih pristopov na motiviranost in znanje dijakov. Vansteenkiste s sodelavci (2009) so s klasifikacijo rezultatov motivacijskih vprašalnikov po metodi K-tega najbližjega soseda ugotovili, da lahko učečo se populacijo, glede na vrednosti avtonomne in kontrolirane motivacije, razdelimo v štiri motivacijske skupine oz. profile: (a) *skupina dobre kvalitete* – z visoko avtonomno motivacijo in nizko kontrolirano motivacijo, (b) *skupina nizke kvalitete* - z nizko avtonomno in visoko kontrolirano motivacijo, (c) *skupina nizke kvantitete* – z nizko avtonomno in nizko kontrolirano motivacijo in (d) *skupina visoke kvantitete* – z visoko avtonomno in visoko kontrolirano motivacijo. Največji učinek na študijske uspehe se je pokazal pri motivacijski skupini *dobre kvalitete*.

METODA

Izbrane module »Izkustvenega pristopa k spektrometriji v vidnem področju«, ki so zasnovani kot aktivna oblika šolskega dela, so dijaki predelali ob samostojnim izvajanjem poskusov in ob sprotnem preverjanju pravilnosti rezultatov. Pred izvedbo modulov so pisali pred-test in po končani izvedbi po-test ter motivacijski test (Juriševič, M. in sodelavci, 2008). Z raziskavo smo želeli: (a) opredeliti motivacijski profil testirancev in (b) ugotoviti povezanost motivacijskega profila s splošnim znanjem kemije (predhodnim učnim uspehom) ter s specifičnim znanjem s področja spektrometrije v vidnem področju, ki so ga dijaki pridobili z izkustvenim pristopom. Kot merske inštrumente smo uporabili pred-test, po-test in vprašalnik motivacije in odnosa do izkustvenega pristopa. Motivacijski vprašalnik sestavlja 41 trditev, do katerih se testiranci opredelijo s pomočjo petstopenjske Likertove lestvice (1- zame ta trditev gotovo ne velja, 5 - zame ta trditev zagotovo velja). S trditvami vprašalnika preverjamo raven avtonomne (notranje, identificirane in regulirane motivacije) in kontrolirane motivacije (zunanje in injicirane) testirancev, njihovo samopodobo in odnos do izkustvenega pristopa. V raziskavi je sodelovalo 77 dijakov dveh srednjih strokovnih šol, ki sta vključeni v projekt. Njihova povprečna starost je bila 16,9 let.

REZULTATI

Klasifikacija dijakov glede na vrednosti kontrolirane in avtonomne motivacije (notranje in regulirane) ter samopodobe z metodo K-tega najbližjega soseda pokaže, da lahko dijake glede na izbrane klasifikacijske kriterije razdelimo v tri skupine. Za dijake, ki pripadajo I. skupini, je značilna nadpovprečno visoka samopodoba (3,39) ter visoka avtonomna (notranja 3,94 in regulirana 3,88) motivacija in podpovprečna kontrolirana motivacija (2,67). Ti dijaki se uvrščajo v motivacijsko skupino *dobre kvalitete*. Dijaki II. in III. skupine sodijo v skupino *nizke kvalitete* (nadpovprečna kontrolirana motivacija (3,39 oz. 3,56) in podpovprečna avtonomna motivacija (notranja 2,11 oz. 2,63 in regulirana 2,48 in 2,88). Skupini se razlikujeta glede na vrednost samopodobe, ki je za dijake II. skupine 2,18, za dijake III. skupine pa 3,36. Slednji dijaki imajo bolj pozitiven odnos do svojih učnih sposobnosti. Na pred-testu med dosežki treh motivacijskih skupin razlike niso bile statistično pomembne. Na po-testu so se pokazale statistično pomembne razlike med različnimi motivacijskimi profili dijakov. Dosežki dijakov motivacijske skupine *dobre kvalitete*, so na ravni signifikantnosti 0,01 boljši od dosežkov dijakov II. skupine in na ravni signifikantnosti 0,05 boljši od dosežkov dijakov III. Skupine. Na po-testu so nadpovprečen rezultat dosegli samo dijaki I. skupine, kar potrjuje vpliv motivacijskega profila na učne rezultate. Statistično pomembne razlike med šolama A in B na ravni signifikantnosti 0,01 so se pokazale le pri dosežkih dijakov na po-testu (šola A 52,2%, šola B 81 %). Ugotovili smo, da ima na razlike v dosežkih tudi v tem primeru vpliv motivacijskih profil dijakov dveh šol. S t-testom smo dokazali statistično signifikantnost razlik med avtonomno in kontrolirano motivacijo dijakov šol A in B na ravni signifikantnosti 0,01. Dijaki šole A se uvrščajo glede na nadpovprečno visoko vrednost kontrolirane motivacije 3,4 in podpovprečno avtonomno motivacijo (regulirana, 2,8 in notranja 2,6) v motivacijsko skupino *nizke kvalitete*, ki imajo tudi podpovprečno samopodobo (2,9). Nasprotno se dijaki šole B uvrščajo v motivacijsko skupino *dobre kvalitete* (visoka avtonomna motivacija: regulirana, 3,7 in notranja 3,6, ter nizka kontrolirana motivacija 2,7). Ti dijaki imajo hkrati tudi nadpovprečno samopodobo 3,7.

ZAKLJUČEK

V raziskavi sta bila identificirana dva motivacijska profila dijakov; motivacijski profil *dobre kvalitete* in *nizke kvalitete*; dijaki v slednji skupini se razlikujejo po samopodobi. Raziskava je potrdila rezultate predhodnih, da imajo najboljše učne uspehe tisti dijaki, ki se uvrščajo v motivacijsko skupino *dobre kvalitete*, tem dijakom tudi najbolj ustreza avtonomni stil poučevanja, ki se je odrazil na rezultatih po-testa. Učinka avtonomnega stila poučevanja (izkustveni pristop) na dosežke dijakov v motivacijsko slabših skupinah dijakov (II. in III. skupina), nismo dokazali. Pokazale so se statistično pomembne razlike med šolama A in B pri dosežkih dijakov na po-testu. Povprečni dosežki dijakov šole B (81 %) so bili statistično pomembno boljši od dijakov šole A (53 %). Glede na vrednosti kriterijev motivacijskega profila se pokaže, da se dijaki šole A uvrščajo v motivacijsko skupino *nizke kvalitete*, dijaki šole B pa v motivacijsko skupino *dobre kvalitete*, zato njihov boljši dosežek na po-testu ni presenetljiv.

LIGHT POLLUTION
/
SVETLOBNO ONESNAŽEVANJE

Marija Jakelj

OŠ Josipa Vandota Kranjska Gora

marija.jakelj@guest.arnes.si

ABSTRACT

Light pollution is impact of artificial light on the environment. It is obvious that excessive lighting has a number of harmful effects on numerous organisms (bats, insects, plants, deer, turtles, amphibious animal), astronomical observations and public health. Furthermore we waste energy with installing lamps for external illumination, shining directly or indirectly into the sky. Pupils of 7th class have made research using methods such as: counting various types of lamps, measuring of illumination, taking photos with digital camera, interviewing competent people, searching data on the net, editing data and measurements in the charts and evaluating results.

Keywords: *light pollution, shaded lamps, unshaded lamps.*

UVOD

Onesnaževanje neba oz. nasploh naravnega okolja z umetno svetlobo je pomembno ekološko, vprašanje. Z obravnavanjem te tematike sledimo splošnim ciljem učnih načrtov prek okoljske vzgoje, tehnike in naravoslovja, ter naravoslovja v 6. in 7. razredu: razvijati sposobnost za zaznavanje in razumevanje ekoloških problemov, razvijati odgovoren odnos do okolja in spodbujati interes za njegovo aktivno varovanje, razvijati spoštovanje do vseh oblik življenja in razumevanje medsebojne povezanosti žive in nežive narave, ter spodbujati kritično presojanje o škodljivosti in negativnem vplivu pretiranih človeških posegov v naravno okolje.

METODA

V 7. razredu ponudim učencem pojem svetlobnega onesnaževanja predvsem kot dodatno delo pri poglavju svetloba.

O svetlobnem onesnaževanju se je začelo govoriti predvsem zaradi onemogočanja raziskovalne in poljudnoznanstvene dejavnosti astronomskih observatorijev. Prvi je na ta problem opozoril astronom Herman Mikuž. Učinek onesnaževanja je žarenje neba, ki je odvisno od meteoroloških pojavov in količine prahu v ozračju. Pokažem jim nekaj vzrokov svetlobnega onesnaževanja: cestne svetilke, okrasna razsvetljava, reklamni panoji, reflektorji in laserji, nepravilno osvetljevanje bivalnih okolij.

Opredelitev nalog:

Učenci sami oblikujejo predstavitev, ki vključuje:

Anketiranje občanov, poiščejo primere slabih in dobrih svetilk in jih fotografirajo, raziščejo posledice svetlobnega onesnaževanja na ljudi in živali, predlagajo ukrepe za zmanjšanje svetlobnega onesnaževanja. Dejavnosti učencev: meritve z luxmetrom, urejanje podatkov in meritev v razpredelnice, analiza rezultatov, štetje raznovrstnih svetilk, dokumentiranje z digitalnim aparatom, ankete in intervjuji s pristojnimi ljudmi, uporaba ustrezne literature, brskanje po svetovnem spletu.

REZULTATI

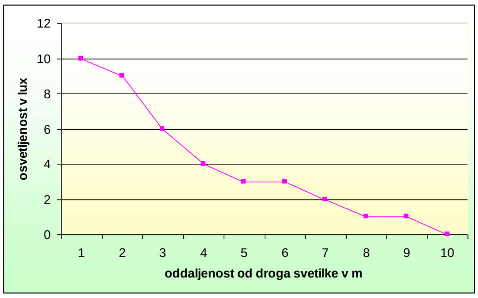
V občini je 430 stoječih nezasenčenih svetilk, 330 stoječih delno zasenčenih svetilk, 7 reflektorjev in 9 talnih svetilk.

Z luxmetrom merimo svetlost osvetljene ploskve, torej, osvetljenost. Merimo lahko osvetljenost glede na oddaljenost od droga svetilke, osvetljenost učilnic in šolskih prostorov.

Cestna delno zasenčena svetilka - Tabela 1

oddaljenost od droga svetilke (m)	1	2	3	4	5	6	7	8	9	10
osvetljenost (lux)	10	9	6	4	3	3	2	1	1	0

Višina droga svetilke je 6m.



Če je razdalja med svetili 2,5-krat večja od njihove višine, so tla osvetljena dovolj enakomerno. S takimi nizi je osvetljena večina slovenskih cest. Med vožnjo po njih žal vidimo ves niz svetilk pred nami, kar nam zmanjšuje kontrast in otežuje razpoznavanje nekontrastnih objektov (pešci). Svetila so vidna od daleč. Poleg energijskih izgub to pomeni oviro za živali in seveda ljudi (bleščanje).

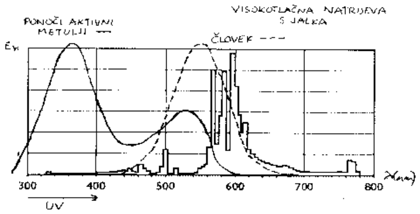
Cestna razsvetljava

Slika1 -Primer dobre svetilke **Slika2 - Primer slabe svetilke**

Posledice svetlobnega onesnaževanja so ekonomske, zdravstvene, astronomske in ekološke.

Svetlobno onesnaževanje je eden od dejavnikov, ki ogroža biotsko raznovrstnost.

Vpliv svetlobnega onesnaževanja na žuželke



Spekter visokotlačne natrijeve sijalke in občutljivost človeškega očesa ter oči nočno aktivnih metuljev.

ZAKLJUČEK

Učenci sami ugotovijo, da bomo svetlobno onesnaževanje zmanjšali, če ne osvetljujemo preveč, če ugašamo luči, ki jih ne potrebujemo, svetlobo usmerimo naravnost navzdol na cilj osvetlitve, osrednji žarek mora biti usmerjen navpično na tla, svetlobo je treba omejiti nad vodoravno smerjo in nameščati natrijeve svetilke, ki ne svetijo belo. Vedno bolj očitno je, da ima pretirano osvetljevanje škodljive vplive na številne organizme (netopirje, žuželke, ptice, rastline, divjad, želve, dvoživke), astronomska opazovanja in zdravje ljudi. Z nameščanjem svetilk za zunanjo razsvetljavo, ki svetijo posredno ali neposredno v nebo, pa poleg omenjenega, tudi nesmiselno trošimo energijo.

Učenci so s to projektno nalogo spoznali, da ljudje še premalo poznajo problem svetlobnega onesnaževanja. K izboljšanju stanja lahko pripomore upoštevanje določb iz Uredbe o mejnih vrednostih svetlobnega onesnaževanja.

MAKING FLOATING CANDLES
/
IZDELAVA PLAVAJOČIH SVEČK

Vida Jaušovec

OŠ Neznanih talcev Dravograd

vida.jausovec@guest.arnes.si

ABSTRACT

The pupils in the seventh class of primary school are within the chemical–physical contents at the school subject natural science introduced also with the topics of the melting and boiling point.

To improve pupils' comprehension of those two abstract terms, I have decided to prepare the experiment – the making of the floating candles. Pupils see and use the paraffin wax in solid state, they melt it on the water bath and with the help of thermometer they practically find out its melting point. Furthermore they add some colours in solid and perfumes in liquid state. The liquid paraffin wax is then poured into the models of different shapes and cooled down till its solidification.

Through this experiment pupils' understanding of physical states of substances, transitions between different states as well as both terms, the melting and the boiling point, is consolidated.

Keywords: *experimental work, physical state, transitions between different states, the melting point, the boiling point.*

UVOD

Pri učnem predmetu naravoslovje v 7. razredu osnovne šole imamo v okviru kemijsko-fizikalnih vsebin tudi razlikovanje med fizikalnimi in kemijskimi spremembami. Fizikalne spremembe so tudi spremembe agregatnih stanj, ki jih dosežemo s prehodi preko tališča in vrelišča. Učenci poznajo tališče in vrelišče vode, težave pa imajo pri poznavanju tališč in vrelišč drugih snovi. S tem namenom smo se pri tej vaji lotili določanja tališča in vrelišča parafina, ki ga učenci srečujejo v vsakdanjem življenju. Ker pri vaji uporabljamo vodno kopel, lahko primerjajo prehode med agregatnimi stanji obeh snovi.

METODA

Da bi dosegla boljše razumevanje te učne snovi sva s kolegico pripravili laboratorijsko vajo «Izdelovanje plavajočih svečk«. Učenci so s pomočjo delovnega lista (Prikaz 1) in navodil opravili vajo, Ob eksperimentalnem delu so si podatke zapisovali in koncu pripravili poročilo o vaji, ki so ga lahko oblikovali in dokončali po delu, Osnutek zanj (Prikaz 2) so dobili pred vajo.

REZULTATI

Učenci so s pomočjo navodil izbrali ustrezna sredstva in pripomočke za izdelavo plavajoče svečke. Pripravili so vodno kopel, s katero so stalili parafin. Izmerili so njegovo tališče in ga primerjali s tališčem, zapisanim v literaturi. Tekočemu parafinu so dodali barvila v trdnem agregatnem stanju. V modelčke so vstavili stenj, nanj vlili obarvan parafin, lahko tudi v več plasteh in različnih barv. Pri tem postopku so samostojno ugotovili, da se plasti med seboj prelivajo in da je smiselno počakati, da se prejšnja plast parafina že malo strdi in se plasti lepše ločijo. Ob razgovoru ugotovijo, da temperaturne točke vrelišča ne bomo mogli praktično izmeriti in da bo parafin to točko dosegel, ko bo svečka gorela.

ZAKLJUČEK

Ob tem delu sem dosegla, da so učenci usvojili znanja o snoveh, njihovih agregatnih stanjih ter prehodih med njimi. Pri laboratorijskem delu utrdimo in upoštevamo načela varnega dela, prav tako pa tudi pomen in zaporedje posameznih etap dela. Učenci se navajajo na urejenost delovne površine, sprotno zapisovanje podatkov ter končno poročanjem pred razredov. Naučijo se pisati laboratorijsko poročilo. Pri tem delu lahko izrazijo smisel za estetiko ter predlagajo izboljšave, npr. dodajanje eteričnih olj, da dobimo plavajoče dišeče svečke. Ob kasnejšem preverjanju se je izkazalo, da učenci bolje razumejo in razlagajo teoretska znanja o snoveh, njihovih fizikalnih in kemijskih spremembah, agregatnih stanjih ter prehodih med njimi.

PRIKAZ 1: Delovni list 1

VAJA: IZDELOVANJE PLAVAJOČIH SVEČK

Navodilo za delo:

Natančno preberi nalogo in potek dela ter pozorno poslušaj učiteljeva navodila, šele nato prični z delom.

Tvoja naloga je:

Izdelaj si plavajočo svečko, pri čemer ugotovi temperaturo parafina iz katerega boš izdelal/-a) svečko in opazuj spremembe agregatnih stanj.

Za delo potrebujem (material in pripomočki): *(Zabeleži si ob poteku dela.)*

-	-
-	-
-	-
-	-

Potek dela:

1. Na vodni kopeli stalimo parafin, pri čemer s pomočjo termometra ugotovimo temperaturo tališča parafina. *Pazimo, da parafina ne pregrejemo!*
2. Ko je ves parafin staljen, ga poljubno obarvamo s pomočjo posebnih barv v obliki tabletk. Parafin mešamo, da se barva enakomerno porazdeli.
3. Tako obarvan parafin vlivamo v naprej pripravljene plastične modelčke.
4. Vstavimo stenj.
5. Napolnjene modelčke pustimo nekaj časa mirovati.

Skice dela:

Opiši svoja opažanja in ugotovitve.

____

Diskusija (razlaga):

- Katere fizikalne postopke smo izvajali?

____

- Katere fizikalne spremembe si opazil/-a) in zakaj je prišlo do njih?

____

- Katere lastnosti agregatnih stanj si lahko opazil/-a?

____

PRIKAZ 2: Delovni list 2

Kako naj napišem laboratorijsko poročilo o tej vaji?

1. UVOD

a) *Teoretske osnove* – v knjigah, leksikonih, učbenikih,… poiščeš in zapišeš informacije:

- spremembe agregatnih stanj,
- poimenovanje prehodov med agregatnimi stanji,
- značilnosti posameznih agregatnih stanj,
- tališče snovi,
- parafin – kaj je to, kako ga pridobivajo,…

b) Namen:

Eksperimentalno ugotoviti temperaturo tališča parafina in opazovati spreminjanje agregatnih stanj le-tega.

2. METODE DELA

a) *Material in pripomočki:* Naštej vse kar si potreboval/-a za izvajanje eksperimenta.

b) *Potek dela:* Natančno opišeš kako smo (ste) delali.

c) *Skice dela:* Narišeš skice, ki si jih skiciral/-a ob eksperimentiranju.

3. REZULTATI

Zapišeš kakšen je bil rezultat dela na posameznih stopnjah:

- kaj se je zgodilo, ko smo parafin segrevali,
- kolikšna je temperatura tališča parafina,
- kaj se je dogajalo s parafinom, ko smo ga pustili mirovati pri sobni temperaturi

4. RAZLAGA, RAZPRAVA (DISKUSIJA)

V tem delu poročila razložiš rezultate s pomočjo teoretskih osnov zapisanih v uvodu:

- kaj se je zgodilo, ko smo parafin segrevali – *Zakaj?, Kako imenujemo ta prehod med agregatnimi stanji?*
- kolikšna je temperatura tališča parafina – *Zakaj takšna temperatura, kako smo jo ugotovili?*
- kaj se je dogajalo s parafinom, ko smo ga pustili mirovati pri sobni temperaturi – *Zakaj?, Kako imenujemo ta prehod med agregatnimi stanji?*

5. SKLEPI

Iz diskusije izpelješ končne ugotovitve (sklepe).

6. KRITIKA

Tu zapišeš:

- Kaj ti je bilo pri vaji všeč in kaj ne? Kaj bi spremenil?
- Kateri del vaje se ti je zdel lažji oziroma težji?
- Ali predlagaš, da bi še v prihodnje izvajali takšne vaje? Zakaj?

7. LITERATURA

Tu zapišeš podatke o knjigah, leksikonih, učbenikih,… (jih citiraš), ki si jih uporabil pri zapisu teoretskih osnov, npr., če si uporabil šolski učbenik lahko zapišeš takole:

- Kolman, A. idr. (2003). Naravoslovje 7, učbenik. Ljubljana: Rokus

WITH THE PROJECT LEARNING WORK TO ECOLOGICAL AWERNESS OF PUPILS
/
S PROJEKTNIM UČNIM DELOM K EKOLOŠKEMU OSVEŠČANJU UČENCEV

Alenka Kastelic

OŠ Rudolfa Ukoviča Podgrad

akastelic@gmail.com

ABSTRACT

The article presents a project in the ecology field. The project took three phases. Pupils recognized burning problems of enviroment pollution by means of didactis games, they sorted waste package and stated positive effects of separated waste collecting. They made some useful products out of the waste package and prepared posters about protecting the enviroment and the meaning of collecting the waste.

The author of the article states that the pupils have assimilated and deepened the recognitions of ecological problems, have recognized the meaning of care for the clean enviroment, have strenghtened the feeling for enviroment protection, have developed positive habits, creativity and interpersonal connections in a group. In this way they formed a positive and critical relation towards the science themes on the visual and cognitive levels.

Keywords: project learning work, enviroment pollution, waste package, a didactic game, useful products

UVOD

Problem onesnaževanja okolja z odpadki je iz dneva v dan večji in bolj zaskrbljujoč. V zadnjem času se tega vse bolj zavedamo, vendar se na tem področju stvari počasi premikajo v pozitivno smer. Spoznanje, da se nekatere odpadne snovi, z reciklažo in obdelavo lahko ponovno uporabijo, je izredno pomembno. Nujno je, da otroci to spoznanje skozi igro že zelo zgodaj uzavestijo in ga sprejmejo kot način življenja.

Skupaj z učenci smo opredelili različne poglede na odpadni material. Seznanili smo se s problemom in nevarnostmi divjih odlagališč smeti, ki lahko privedejo do zelo resnih in hudih problemov onesnaževanja. Učenci so spoznali, kaj je to embalaža in se jo naučili ločiti glede na to iz česa je. Seznanili so se z ekološkimi otoki, ki so namenjeni ločenemu zbiranju odpadkov. Tako smo jih spodbudili, da tudi sami skrbijo za razvrščanje odpadkov v domačem okolju. Pri učencih smo želeli vzbuditi občutek za skrbno ravnanje z odpadnimi snovmi in jih seznaniti s predelavo ter ponovno uporabo odpadnih materialov.

Učenci so spoznavali projektno učno delo, ugotavljali kako sami vplivajo na naravo, kako lahko dejavno prispevajo k varovanju in ohranjanju čistega okolja, kako nastajajo odpadki, za katere je potrebno poskrbeti, kako lahko odpadke sortiramo, recikliramo in ponovno uporabimo. Učenci so razvijali tudi ročne spretnosti ter tehnično ustvarjalnost. Gojili so ustvarjalnost in medsebojno povezanost v skupini.

METODA

Projekt je potekal s prvošolci v oddelku podaljšanega bivanja na način projektnega učnega dela. Potekal je v treh fazah. Učenci so bili aktivno vključeni v vse faze projekta, od postavitve problema, načrtovanja, priprave dela, preko izvedbe do vrednotenja izdelkov.

Z učenci smo v prvem delu najprej prebrali zelo poučno knjigo Mateje Reba z naslovom Jurček in packarija, ki na otrokom primeren način, prikaže aktualne vsebine s področja varstva okolja in ekologije. Igrali smo se tudi razne didaktične igre, ki so otrokom približale problem onesnaževanja okolja. Ker je otrok zvedavo bitje in ga zanima vse kar ga obdaja, smo v naslednjem koraku izkoristili ravno to značilnost. Učence smo vodili in usmerjali pri opazovanju bližnjega okolja ter s tem razvijali njegovo radovednost in iskanje, ki ga vodita k vedno bolj urejenemu spoznavanju okolja. Z učenci smo si najprej ogledali bližnjo okolico šole. Opazovanje je bilo načrtovano in usmerjeno. Učenci so bili zelo pozorni opazovalci. Videli so tudi najmanjše smeti, ki jih drugače sploh ne opazijo. Seveda smo odpadke sproti pobirali v vrečko. Napotili smo se do divjega odlagališča, kjer so učenci opazili zelo veliko nepravilno odloženih odpadkov. Ugotovili so, da to lahko naredi le človek, zato so bili zelo kritični. Pot nas je vodila v središče naselja, kjer smo si ogledali ekološki otok. Prebrali smo piktograme in napise na zabojnikih. Opazili smo, da se zabojniki ločijo tudi po barvi. Učenci so ugotovili, da ljudje bolje skrbijo za čisto okolico v samem naselju, kot izven naselja. Učenci so risali stvari, ki so se jim ob raziskovanju okolice najbolj vtisnile v spomin.

V drugem delu so razvrščali odpadno embalažo glede na določene lastnosti in ugotavljali pozitivne učinke ločenega zbiranja odpadkov. Po predhodnem dogovoru so učenci zbirali in prinesli v šolo najrazličnejšo embalažo. Ugotavljali so iz česa je (les, steklo, kovina, plastika, papir…) in jo glede na to tudi razvrščali. Spoznali so, da so lahko različni predmeti iz iste snovi ali da so enaki predmeti iz različnih snovi. Nekatere lastnosti snovi so določali s čutili (barva, otip, zven, vonj).

V zadnjem delu so iz odpadne embalaže izdelovali uporabne izdelke in oblikovali plakate o varovanju okolja in pomenu ločenega zbiranja odpadkov. V sklepnem delu so učenci izdelke kritično ocenili in jih postavili na razstavo. Z uporabo odpadnega materiala za izdelovanje izdelkov se je v učencih krepil občutek za varovanje okolja, učenci so razvijali ustvarjalnost in medsebojno povezanost v skupini.

REZULTATI

Učenci so z veseljem sodelovali pri delu. Pomembno se jim je zdelo, da so bili vključeni v projekt od ideje do vrednotenja in razstave. Vsakemu učencu je bilo omogočeno, da odkriva in uresničuje svoje zmožnosti ter pridobi občutek samozavesti in zadovoljstva ob uspešno opravljenem delu. Iz spoznanj in izkušenj, ki so jih učenci pri projektnem učnem delu dobili, lahko črpajo pobude za učenje in s tem širijo svoje znanje in ustvarjalnost.

Cilji projekta so bili doseženi. Učenci so bili s tako obliko dela zelo zadovoljni. Kljub temu, da so veliko delali, spoznali veliko novega, se veliko naučili, v delo vključevali vsa svoja čutila, niso imeli občutka, da so v šoli in da gre zares. Zadovoljili so potrebo po gibanju, druženju in izmenjavi izkušenj, medsebojni pomoči in znanju. Hkrati pa poglabljali spoznanja ekološke problematike, spoznavali pomen skrbi za čisto okolje, krepili občutek za varovanje okolja, razvijali pozitivne navade, oblikovali pozitiven in kritičen odnos do naravovarstvenih vsebin na vizualni ter spoznavni ravni.

ZAKLJUČEK

Prepričana sem, da s tem, ko so učenci spoznali prijazen in pozitiven odnos do okolja, obstaja večja možnost, da bodo spremenili odnos do narave in se naučili koristno uporabljati odpadne snovi in embalažo. Zavedam se, da je to le kapljica v morje. Toda, če ne bi bilo kapljice, tudi morja ne bi bilo.

LIFELONG LEARNER AND CHEMISTRY
/
VSEŽIVLJENJSKI UČENEC IN KEMIJA

Zvonka Kladnik

JVIZ Mozirje, OE OŠ Rečica ob Savinji

Zvonka.kladnik@gust.arnes.si

ABSTRACT

At chemistry class examples from everyday life offer endless possibilities to us. Examples from everyday life may help explain and teach the majority of chemical laws and definitions, which otherwise the students find rather abstract and, in most cases, difficult to understand. The question: »Why are roads salted in winter?« Is taken from everyday life, if it is included in the learning process. While students learn about basic chemical laws and the concepts, which are prescribed by the curriculum for chemistry pupils are encorraged to think creatively. We use new knowledge about learning, taking into account the differentiation, stimulate creative thinking and prepare students for lifelong learners.

Keywords: *life-long learner, increase learning, understanding learning, understanding concept, creative thinking.*

UVOD

Učitelj lahko znanje ponudi, pripravi pripomočke za učenje, poskuša vzbuditi pozornost, vlaga napore v razmere, da bi bile te za učenje najprimernejše. Ne more pa se namesto učencev naučiti. Učenje je oseben proces. Koliko ponujenega znanja kdo sprejme, odloča vsak sam. Vendar pa je potrebno učenje pri učencih povečati, spodbujati pozitivna čustva in ga narediti zanimivega, da ga sprejemajo pozitivno in da to postane trajno. Vprašanje pa je, kaj poveča učenje. Pri opazovanju otrok v njihovem okolju lahko opazimo njihovo naravno radovednost in visoko stopnjo učenja pri dejavnostih, ki so jim zanimive. Ta opazovanja nam omogočajo načrtovanje učnega procesa, ki bo pri učencih vzpodbudil njihovo naravno potrebo po učenju. Izhodišče poučevanja bi moralo temeljiti na učenčevem predznanju, ki ga pri učnem procesu nadgrajujemo. Na ta način učenci nova spoznanja povežejo z že obstoječimi vedenji. Shulman (1986) pravi, da je učitelj tisti, ki bo preoblikoval znanstvena dogajanja v takšno obliko, da bo učencem razumljiva. Pri tem je osrednji element vedenje učiteljev, da znanstvene vsebine prilagodi različnim interesom in sposobnostim učencev in ga prenese v pouk. Za učitelje je pomembno, da vedo, kako učencem razložiti znanstvene pojme in koncepte. Razumevanje konceptov je pomembno v razvoju učenčevega razumevanja delovanja sveta. Tako Schmidt in Volke (2003) razlikujeta med definicijami, izrazi in pomenom konceptov. Saj kot pravita Pines in West (1986), koncepti, ki imajo drugačen pomen v znanosti in v vsakdanjem življenju, lahko učence zmedejo.

Zaradi tega je potrebno razmišljati, da pri učencih vključujemo v učenje teme, ki so pomembne za razumevanja vsakdanjega življenja in da tako ti postanejo vseživljenjski učenci.

METODA

Pri pouku kemije nam primeri iz vsakdanjega življenja nudijo nešteto možnosti. S primeri iz življenja lahko razložimo in naučimo večino kemijskih zakonitosti in definicij, ki so sicer za učence dokaj abstraktne in v večini primerov težko razumljive. Z usmerjenim pristopom poučevanja, poskušam pri učencih v učenje vključevati teme, ki so pomembne v življenju.

Vprašanje: »Zakaj pozimi solijo ceste?« je vzeto iz življenja, če ga vključimo v učni proces in izvedemo kot problemski pristop, spodbujamo kreativno razmišljanje, pri tem učenci spoznavajo osnovne kemijske zakonitosti in pojme, ki jih predpisuje učni načrt za kemijo. Uporabimo nova vedenja o učenju, upoštevamo diferenciacijo, spodbujamo kreativno razmišljanje in pripravimo učence za vseživljenjske učence.

Učencem postavim omenjeno problemsko vprašanje, za katerega morajo predvideti hipotetičen odgovor in ga nato z eksperimentom preveriti. Pripraviti morajo načrt raziskave in jo izvesti. Po raziskavi - eksperimentu, dobijo odgovore na nekatera vprašanja, kot so: znižanje tališča in pomen le- tega v vsakdanjem življenju. Ta način dela od učencev zahteva:

- da se odločajo o možnih rešitvah,
- da se odločajo za najboljšo rešitev,
- da utemeljijo pravo izbiro,
- da poročajo o tem, kaj so se naučili o dejavnosti (ne o vsebini, temveč procesu).

REZULTATI

Po končanem delu poteka evalvacija, kjer učenci razmišljajo o poteku dela in zaključkih, do katerih so prišli. Rezultate predstavijo v obliki tabel in grafov ter pripravijo načrt smiselnosti in potrebe po soljenju cest. Upoštevati morajo zahteve varstva okolja in predvideti vremenske razmere. Učencem omogoča razviti bolj trdno, integrirano, koristno razumevanje konceptov ter njihovih medsebojnih povezav in uporabnost. Poudarek je na razumevanju in ne na golem učenju podatkov ter na sklepanju namesto na podajanju odgovorov.

ZAKLJUČEK

Problemski pristop učencem omogoča boljše poznavanje pomena povezave znanosti z družbenimi vprašanji. Učenci razvijajo kompleksnejši pogled na kemijsko znanost, ne zgolj kot na predmet kemija ampak na vedo, ki je vpeta v naš vsakdan.

ABSTRACT

According to the revised curriculum, the teaching of science-based subjects is becoming highly integrated by introducing interdisciplinary and team teaching.

Laboratory work in chemistry and biology offers the opportunity for active forms of instruction, which include a new approach of learning and teaching, and thus a new culture verification and evaluation of knowledge. Interdisciplinary work is carried out in a condensed form, where students in groups of 4 deal with experimental properties by using chemical and biological methods. The students of the groups independently plan, implement and present their findings in the form of multimedia presentations and written reports.

Keywords: *team teaching, interdisciplinary teaching, cooperative learning, experimental learning, a new culture of teaching*

UVOD

Za razumevanje izsledkov naravoslovnih znanosti je nujno medpredmetno povezovanje znotraj fizike, kemije in biologije kot tudi z ostalimi predmeti. Poleg uveljavljenih naravoslovnih in projektnih dni lahko tako izvedemo tudi običajne laboratorijske vaje.

Z uvajanjem posodobljenih učnih načrtov se učiteljem kemije in biologije ponuja veliko tem, ki jih lahko s timskim poučevanjem obdelamo v razredu. Bistvo timskega poučevanja je vzajemna povezanost učiteljev, ki si med seboj pomagajo in dopolnjujejo. Tim učiteljev ne predvideva le odnosov med učitelji, ampak tudi med učitelji in učenci. Tovrstno delo je dober zgled dijakom o medsebojnem sodelovanju, saj vsak učitelj vnaša v pouk svoje strokovne in osebnostne posebnosti, po katerih je prepoznaven med učenci, sodelavci in starši. Za timsko poučevanje so še posebej zanimive teme, pri katerih lahko dijaki s sodobnimi oblikami dela osvojijo tako procesne kot vsebinske cilje. Prednost timskega poučevanja je vsekakor sodelovalno načrtovanje in nenehno sodelovanje tako pri izvedbi kot pri vrednotenju dijakovih učnih dosežkov. Za profesorje tovrstno delo zahteva veliko več načrtovanja in fleksibilnosti kot pri klasični izvedbi pouka.

Na Šolskem centru Novo mesto smo si v projektu Posodobitev gimnazije zadali za prioritetno nalogo medpredmetno povezovanje in timsko delo. Ker medpredmetno povezovanje predstavlja didaktični pristop, kjer učitelj poskuša določeno vsebino podati in obravnavati čim bolj celostno, smo si profesorji biologije in kemije zadali cilj pripraviti čim več kakovostnih navodil za izvedbo medpredmetno načrtovanih laboratorijskih vaj. Če upoštevamo, da je znanje paleta veščin in spretnosti ter je pouk usmerjen v načrtno razvijanje teh spretnost in veščin, je treba temu prilagoditi tudi preverjanje in ocenjevanje. Pri pouku kemije in biologije se lahko vrednoti znanje s sposobnostjo reševanja avtentičnih nalog in problemov, ki jih vpeljemo v laboratorijsko delo. Na ta način dijake navajamo na uporabo pridobljenih znanj pri reševanju problemov, s katerimi se soočamo v življenju. Pri spremljanju in vrednotenju znanja lahko vključimo tudi procesne spretnosti, kot so načrtovanje, opazovanje, preizkušanje, interpretiranje in podajanje zaključkov.

METODA

Medpredmetno načrtovane vaje smo izvedli v strjeni obliki po dve ali tri šolske ure s skupino šestnajstih dijakov treh oddelkov prvega letnika tehniške gimnazije. Pri izvedbi smo sodelovali profesorji kemije in biologije. Za izvedbo vaj smo izdelali navodila za laboratorijsko delo, ki vključujejo sodobne oblike pouka, kot so sodelovalno učenje, raziskovalno učenje, delo z viri, uporaba IKT, učenje učenja,… Pri izvedbi laboratorijskih vaj smo težili k temu, da so dijaki šli skozi vse pomembne faze izgrajevanja spoznanj in njihove uporabe. Dijaki so samostojno načrtovali in izvedli enostavne laboratorijske vaje. Pri tem so varno uporabili osnovne znanstvene raziskovalne metode, poiskali relevantne informacije iz različnih virov (elektronskih, pisnih in ustnih) in kritično ovrednotili njihovo zanesljivost. Ugotavljali so skupne značilnosti in razlike, luščili bistvo, sklepali in preizkušali svoje hipoteze. Sledile so razprave in strjevanje zaključkov. Laboratorijske vaje so se zaključile z multimedijskimi predstavitvami.

Največja novost so izdelani opisniki za vrednotenja znanja, ki so dober pripomoček za preverjanje in ocenjevanje znanja tako profesorjem kot dijakom in njihovim staršem. Sestavljeni so tako, da dijaka spremljajo od faze načrtovanja preko izvedbe do zaključka laboratorijskega dela s pripravo poročila in predstavitve vaje ostalim sošolcem.

REZULTATI

Rezultat medpredmetno načrtovanih laboratorijskih vaj so tri interna gradiva pri različnih učnih temah kemije in biologije, ki vključujejo medpredmetno pripravo na pouk, navodila za laboratorijske vaje, opisnike za preverjanje in ocenjevanje znanja ter evalvacijske vprašalnike.

V enem letu smo uspeli oblikovati spletno učilnico za kemijo in biologijo, v kateri so objavljena vsa nastala gradiva. Dijaki so po opravljeni evalvaciji izrazili zadovoljstvo nad tem, da imajo dostopna navodila za laboratorijsko delo, opisnike ocenjevanja, primere poročil skupin dijakov o opravljenih laboratorijskih vajah in multimedijske predstavitve.

Na takšen način razvijamo sposobnost raziskovalnega in kompleksnega razmišljanja, saj določeno snov spoznavajo po kemijskih lastnostih in biološki vlogi v živih sistemih.

ZAKLJUČEK

Po izvedenih evalvacijah in samoevalvacijah ugotavljava, da je sodelovalno raziskovalno delo pri dijakih dobro sprejeto. Dijaki so v enem šolskem letu razvijali ključne kompetence, ki so predvidene z učnim načrtom, saj medpredmetno načrtovane laboratorijske vaje v ospredje postavljajo posameznika, ki preko aktivnih oblik učenja postopoma izgrajuje svoje znanje.

S timskim poučevanjem so dijaki zadovoljni, saj imajo istočasno na voljo učitelja kemije in biologije, ki z zastavljanjem intelektualnih dilem od učencev zahtevata vse bolj poglobljen razmislek.

PROJECT LEARNING – MAKING OF A GO-CART
/
PROJEKTNO UČENJE – IZDELAVA VOZILA KART

Ivan Klenovšek

Gimnazija Jurija Vege Idrija

ivoklenovsek@yahoo.com

ABSTRACT

Efficiency-orientated society demands that pupils at the end of their technical education are able to think independently, that they are personally initiative and have organizing abilities. Classical school could not realize this task, neither in terms of time or content. That is the reason why we choose the form of educational project work where the contents of at least three regular subjects were connected.

Each pupil had his own field of work, mentors task was to direct and coordinate pupils' work and also to acquire sponsors and ensure equipment, materials and other necessary means.

Project work provides learning from own experience which increases the quality and long term acquired knowledge. That was established and confirmed at graduational examinations and at presentations of our product.

Keywords: *project learning, interdisciplinary correlations, creative ideas, team work, product presentation.*

UVOD

Gokart so izumili zdolgočaseni ameriški piloti, ki so si v prostem času iz kosilnic sestavljali majhne avtomobilčke za dirkanje. Ta njihova zabava se je hitro razvila v zelo zanimiv in popularen šport. Zanimivo je, da sploh nimajo natančno definiranega imena saj jih lahko imenujemo različno (go carts, go karts, shifter cars, supercarts,…)

Vožnja z gokartom je prav posebna izkušnja, občutek imamo kot da bi sedeli v formuli. Stil vožnje je podoben, le da so hitrosti dosti manjše. Veliko dirkačev je svoje kariere začelo prav na gokartu, saj je odličen za učenje osnov dirkanja. Z gokartom dirka tudi veliko amaterjev, ki si želijo preproste adrenalinske zabave na štirih kolesih.

Gokart je poseben tudi zato, ker nima vzmetenja, zato mora biti šasija toliko bolj fleksibilna a obenem dovolj toga da gokart ostane na cesti še posebej v zavojih. Motorji za gokart so 2 in 4 taktni bencinski ali električni. 2 taktni motorji so ponavadi vzeti z motorjev kot so Honda, TM, Stratton ali namensko narejeni tekmovalni motor Rotax, medtem ko so 4 taktni motorji ponavadi standardni motorji kosilnic.

Dijaki so z izdelavo čisto pravega karta uresničili mladostne sanje o dirkanju in hkrati opravili del zrelostnega izpita na svoji izobraževalni poti.

METODA

V projektu smo takoj opazili možnost, da dijaki povežejo znanja, pridobljena pri različnih predmetih med šolanjem in jih združijo v snovanju, izdelavi, montaži, preizkušanju in predstavitvi celovitega izdelka.

Področje motornih vozil je dijakom relativno blizu in jih privlači. Ker pa je izdelava takega vozila povezana z učno snovjo njihovega izobraževanja, je bila odločitev za tak izziv še toliko lažja in s strani maturitetne komisije brez pomislekov potrjena. Pri realizaciji takega projekta dijaki pridobivajo izkušnje, znanje, spretnosti in sposobnosti, oblikujejo se osebnostne lastnosti, torej se vsestransko in celostno razvijajo.

Z izdelavo takega vozila so dijaki pobližje spoznali projektno učno delo, se naučili dela v skupini ter uresničili sanje mnogih profesorjev – mentorjev po uvedbi take oblike dela, ki omogočajo medpredmetne povezave v večji meri kot pri ostalih učnih metodah klasičnega pouka.

REZULTATI

Dijaki so delali ob prostem času, popoldan in od koncu tedna. Glavni nosilec aktivnosti v vseh etapah je dijak sam, učitelj pa je pobudnik in svetovalec. Kot mentor sem dijakom pomagal navezovati stike s sponzorji, ki so nam pomagali z določenimi deli in materialom, pa tudi s storivami na strojih, ki jih v šoli nimamo na razpolago.

Dijaki si lahko v okviru 4. izpitne enote poklicne mature sami izberejo temo in naslov naloge. Dijaki skupaj z mentorjem dokončno izoblikujejo idejo ter pripravijo načrt za uresničitev ideje, ves potreben material in pripomočke.

Delo je potekalo po fazah, kot je prikazano v nadaljevanju.

Po končanem sestavljanju izdelka in njegovem funkcionalnem preizkusu je sledil zagovor pred šolsko maturitetno komisijo, kjer so predstavili potek dela po posameznih zadolžitvah in fazah izdelave.

Komisija je bila z zagovorom zadovoljna in njihov izdelek ocenila z najvišjo možno oceno.

V naslednjih dneh je sledilo še nekaj predstavitev njihovega dela sošolcem, osnovnošolcem, staršem in ostalim zainteresiranim ter predstavnikom sedme sile, ki so pripravili zanimive članke in radijske oddaje.

Slika 1: Načrtovanje vozila   Slika 2: Izdelava podvozja

Slika 3: Sestavljanje vozila   Slika 4: Predstavitev vozila

ZAKLJUČEK

Po zaključku projekta lahko ugotovimo, da je bilo delo dijakov uspešno. Dosegli so večino učnih ciljev, zadanih na začetku šolanja med katerimi moramo poudariti sposobnost za samostojno razmišljanje in delo, sodelovanje v skupini in ne nazadnje realizacujo generiranih idej.

KEYTONATURE PROJECT AND USE OF INTERACTIVE IDENTIFICATION TOOLS AT CLASS OF NATURAL SCIENCE AND OF BIOLOGY IN SLOVENIA / PROJEKT KEYTONATURE TER UPORABA INTERAKTIVNIH DOLOČEVALNIH KLJUČEV PRI POUKU NARAVOSLOVJA IN BIOLOGIJE V SLOVENIJI

Irena Kodele Krašna

Prirodoslovni muzej Slovenije

irena.kodele-krasna@guest.arnes.si

ABSTRACT

The aim of this paper is to present some of the results of testing of new interactive e-tools for learning and teaching biodiversity which were developed in ongoing eContentplus European project KeyToNature. These interactive identification tools are tailored to the needs of different educational users. We found out that identification of organisms with these tools is not easy only for students but also for primary schools pupils who just learned to read.

Keywords: *KeyToNature, identification tools, biodiversity*

UVOD

KeyToNature - KljučDoNarave je triletni ciljni evropski projekt v okviru programa eContentplus, ki poteka v enajstih državah Evropske skupnosti, vanj pa je vključenih štirinajst vodilnih evropskih ustanov s področja biologije, vzgoje in izobraževanja ter informacijske tehnologije. Namen projekta je oblikovanje takih interaktivnih določevalnih orodij, ki jih bodo pri spoznavanju biotske pestrosti učinkovito uporabljali osnovnošolci, srednješolci in študentje širom Evrope. Prednosti novih interaktivnih določevalnih orodij pred klasičnimi določevalnimi ključi je predvsem v njihovi prilagodljivosti potrebam učiteljev in sposobnostim učencev.

Začetni fazi projekta, v kateri se je ugotavljalo potrebe po določevalnih orodjih pri pouku in izdelalo prve interaktivne določevalne ključe, je sledilo testiranje le-teh v evropskih izobraževalnih ustanovah vseh nivojev od osnovnih šol do univerz. Poleg izobraževalnih seminarjev, na katerih smo učiteljem predstavili nova določevalna orodja, možnosti njihove uporabe in prilagajanja za potrebe pouka, smo izvedli tudi več osebnih svetovanj učiteljem. Do sedaj je bilo v slovenskem jeziku narejenih preko 50 določevalnih orodij, vsa pa so prosto dostopna preko spleta in učitelji jih vedno pogosteje uporabljajo. Na podlagi odzivov učiteljev se določevalna orodja nadgrajuje in izpopolnjuje, vzporedno pa se razvija tudi možne scenarije njihove uporabe.

METODA

Nova interaktivna določevalna orodja smo testirali v osnovnih in srednjih šolah po Sloveniji. Učitelje smo vabili k sodelovanju preko medijev in na srečanjih študijskih skupin. Analizo uporabnosti določevalnih orodij smo naredili na podlagi izpolnjenih anketnih vprašalnikov, ki so nam jih poslali učitelji. Testiranja na predmetni stopnji osnovne šole in v srednjih šolah so izvedli učitelji sami, testiranja na razredni stopnji osnovne šole pa so potekala ob pomoči biologa – sodelavca projekta KeyToNature iz Prirodoslovnega muzeja Slovenije. Uporabnost določevalnih orodij smo testirali v različnih okoljih – v računalniški učilnici in na terenu, kjer smo uporabili prenosne računalnike in mobilne telefone. V primeru večjih skupin (preko 40 učencev) smo uporabili natisnjeno obliko določevalnega ključa. Učenci nižjih razredov osnovne šole so uporabili manjše, njim prilagojene določevalne ključe (npr. Ključ za določanje rastlin na travniku pred šolo v Budanjah).

REZULTATI

Izpolnjene anketne vprašalnike nam je vrnilo 19 učiteljev, od tega 5 učiteljev razredne stopnje in 12 učiteljev predmetne stopnje osnovne šole ter 2 gimnazijska učitelja. Skupno je v testiranjih sodelovalo 710 učencev in dijakov. Največkrat uporabljeni določevalni ključ je bil Interaktivni vodnik za določanje lesnatih rastlin Slovenije (31%), v 5-ih primerih (26%) pa so učenci delali s ključem, ki je bil narejen za točno določeno šolo. Uporabili smo predvsem dihotomne določevalne ključe (90%), saj ključi s kompleksnim pristopom zahtevajo od učencev več predznanja in izkušenj.

Interaktivni določevalni ključi so se izkazali kot zelo uporaben pripomoček tako pri rednem pouku kot pri izvedbi naravoslovnih oz. tehničnih dni ter interesnih dejavnosti. Po kratki predstavitvi dela z določevalnimi ključi in razlagi osnovnih pojmov, ki so v ključih uporabljeni, so z njimi samostojno določali organizme tudi učenci prve in druge triade osnovne šole. Ob delu z določevalnimi ključi so učenci spoznavali rastline in živali značilne za določeno življenjsko okolje (travnik, gozd, potok…), spoznavali zgradbo rastlin oz. živali, razvrščali rastline v sistem, razvijali so funkcionalno rabo branja, vadili sodelovalno in samostojno učenje… Vsi učitelji, ki so sodelovali v anketi, bi dejavnost, pri kateri so uporabili določevalne ključe, še ponovili. Učencem je bilo pri teh dejavnostih všeč predvsem to, da so bili aktivni in samostojni pri delu. Dejavnosti so se izkazale za uspešne ne glede na to, katera oblika ključa je bila uporabljena (interaktivni ključi na računalnikih ali natisnjeni na papir) in kje je dejavnost potekala (v učilnici ali na prostem) (Slika 1). Velika večina (80%) učiteljev meni, da se je po izvedeni dejavnosti z določevalnimi ključi zanimanje učencev za biotsko pestrost zelo povečalo.

Slika 1: Uporaba KeyToNature določevalnih ključev (a – učenci razredne stopnje osnovne šole z natisnjeno obliko ključa, b – učenci predmetne stopnje osnovne šole z interaktivnim določevalnim ključem na računalniku, c – gimnazijka z interaktivnim določevalnim ključem z dostopom do baze fotografij preko spleta)

ZAKLJUČEK

Ugotovili smo, da so nova določevalna orodja zelo primerna za samostojno ali skupinsko delo učencev, da omogočajo diferenciacijo pouka na enostaven način, da jih učenci z veseljem uporabljajo in da ne pomenijo samo popestritev pouka, ampak da je z njimi doseganje zastavljenih učnih in vzgojnih ciljev lažje, znanje pa trajnejše.

PROJECT DAYS IN THE UPPER IDRIJCA REGIONAL PARK
/
PROJEKTNI DNEVI V KRAJINSKEM PARKU ZGORNJA IDRIJCA

Romana Kokošar

Gimnazija Jurija Vege Idrija

romanakokosar@gmail.com

ABSTRACT

The project days involve two mainly science projects where the students practise experimental and field work. In the first project they work in groups where they either research chemical and geological ground composition and study vegetation, or they use the bicycle to get to different points where the measurements are done and later the tables designed. The final result is a brochure that includes the bicycle-path map and its description. The second project is based on interdisciplinary connection of three science subjects pursuing each its own aim and also one common aim – determination of the biotic index of the river.

Keywords: *regional park, field work, authentic learning, bicycle-path map, biotic index of a river.*

UVOD

Predstavila bom dva pretežno naravoslovna projekta, ki ju izvajamo v prvem oz. drugem letniku gimnazijskega programa in ju povezuje skupen prostor raziskovanja: Krajinski park Zgornja Idrijca. Ta prostor je bil izbran zaradi potrebe in želje, da učenci, ki obiskujejo našo šolo, spoznajo naravne in kulturne znamenitosti tega krajinskega parka, ki nosi izredno težo in pomen za idrijsko občino.

METODA

Prvi od obeh projektov se izvaja **v prvem evropskem oddelku**. Interdisciplinarno se poveže več naravoslovnih predmetov, sodelujejo pa tudi učitelji predmetov informatike, slovenščine, umetnostne vzgoje in športne vzgoje. Dijaki se že prej odločijo za sodelovanje v eni od treh skupin. Prva skupina na izbranem območju parka raziskuje kemijsko in geološko strukturo tal ter proučuje vodilne rastlinske vrste oz. živali v podrasti in na drevesih. Druga skupina opravi določen del poti s kolesi in meri nadmorske višine, prevoženo pot in čas vožnje, nato smiselno oblikuje tabele, vanje vnaša meritve, izračuna strmino klanca. Tretja skupina se seznani z delovanjem klavž in pomenom tega tehniškega spomenika v idrijski preteklosti, nato pa fotografira posamezne motive na terenu, v šoli pa fotografije računalniško obdela in ustvari fotostrip. Za našo predstavitev bi se podrobneje ustavili pri metodi dela prvih dveh skupin.

V prvi skupini se medpredmetno povežejo kemija, biologija in geografija.

Pri kemiji izvajajo terensko delo: izkopljejo talni profil, določijo horizonte in v vsakem izmed njih s pomočjo kovčka za analizo tal in vode določijo teksturo, obstojnost strukturnih agregatov, prekoreninjenost, barvo, vonj, reakcijo tal, proste karbonate, vsebnost dušika, fosforja. Na podlagi vseh analiz določijo vrsto tal in predvidijo lastnosti tal: zračnost, prepustnost za vodo, vsebnost hranil.

Pri biologiji in geografiji raziskujejo geološko sestavo tal, prepoznavajo značilnosti kamnin in ocenijo površino jezera in dolžino Jezernice; pobirajo in proučujejo živali v podrasti in na drevesih ter nabirajo posamezne vodilne rastlinske vrste in jih poimenujejo; po delu v laboratoriju dokumentirajo, urejajo in klasificirajo.

V drugi skupini se medpredmetno povežejo športna vzgoja, matematika in fizika. Učenci morajo s kolesi opraviti krožno kolesarsko pot in na kontrolnih točkah opravljati meritve. Merijo nadmorske višine, prevoženo pot in čas vožnje ter zapisujejo podatke. Nato v šoli oblikujejo tabele in vanje vnašajo meritve. Računajo povprečne hitrosti na posameznih odsekih poti, rišejo prerez prevožene poti in graf povprečne hitrosti v odvisnosti od prevožene poti.

Drugi od obeh projektov temelji na interdisciplinarni povezavi treh naravoslovnih predmetov, ki so si zastavili skupen cilj, hkrati pa sledijo svojim internim ciljem.

Pri biologiji dijaki s pomočjo vodnih mrež nabirajo vzorce vzdolž rečnega toka. Nabrani material orientacijsko določijo s pomočjo določevalnih ključev. Rezultate vpišejo v delovne liste in s pomočjo tabel o vrstah in številu indikatorskih organizmov ter z rezultati kemijskih in fizikalnih meritev predvidijo kvaliteto vode v raziskovani reki. V okviru fizike dijaki pri pouku s pomočjo fizikalnih zvez, ki jih že poznajo, izpeljejo enačbo za masni pretok. Enačbo za potencialno energijo in moč rečnega toka izrazijo z masnim pretokom. Iščejo rešitve za izmero vseh parametrov za določitev masnega pretoka.

V krajinskem parku merijo hitrost rečnega toka in njegov presek. S pomočjo delovnih listov računajo pretok in energetski potencial zgornjega toka Idrijce ter ga primerjajo z močjo HE Mrzla Rupa. S položnic za dobavo elekrične energije računajo povprečno moč, ki jo troši posamezno gospodinjstvo. Izračunajo število gospodinjstev, ki ga lahko oskrbuje HE Mrzla Rupa, in tako ovrednotijo vlogo malih HE pri varovanju okolja. Pri kemiji pred odhodom na teren odvzamejo vzorec onesnažene vode reke Idrijce v mestu, nato pa še vzorec domnevno čiste vode v Krajinskem parku. Oba vzorca analizirajo s pomočjo analiznega kovčka. Prepoznavajo in podajajo opise organoleptičnih lastnosti vzorcev. Dobljene rezultate vnašajo v popisni list za kemijsko analizo vode in ga dopolnijo s temperaturo vode, ki so jo izmerili pri biologiji

REZULTATI

Izpostavimo najprej rezultate projekta, ki se izvaja v 1. evropskem oddelku. V okviru kemije na podlagi vseh analiz določijo vrsto tal in predvidijo lastnosti tal.

Pri biologiji in geografiji opravijo izbor posameznih vodilnih rastlinskih vrst in obdelajo značilnosti ter

predstavijo botanične in geološke značilnosti Divjega jezera. V kolesarski skupini, kjer igrata glavno vlogo matematika in fizika, grafično ponazorijo prevoženo kolesarsko pot in izdelajo zgibanko za potrebe turistične ponudbe v kraju.

Rezultati drugega projekta, ki združuje biologijo, kemijo in fiziko ter poteka v drugem letniku, pa, kot že omenjeno, zadostijo tako internim ciljem posameznih predmetov kot skupnim ciljem. Pri predmetu biologije je cilj dosežen, ko dijaki zgornji tok reke Idrijce prepoznajo kot ekosistem in ko znajo določiti BI (biotski indeks) reke. Pri fiziki dijaki določijo energijski potencial Idrijce v zgornjem toku s pomočjo masnega pretoka in ovrednotijo izračunano vrednost. Pomemben je tudi odgovor na vprašanje, kakšna je vrednost malih HE za elektroenergetski sistem. Pri kemiji pa dijaki opišejo organoleptične lastnosti vode in spoznajo ter izvedejo metodo kemijske analize vode.

Končni rezultat pa je seveda vrednotenje dobljenih rezultatov oz. določanje biotskega indeksa reke. Pomembno je tudi kompleksno strokovno poročilo, v katerem morajo dijaki odgovoriti na vprašanje, s katerimi rezultati meritev so se približali globalni sliki stanja reke Idrijce.

ZAKLJUČEK

Tako pri prvem kot pri drugem projektu so bili povezovalni elementi delo na terenu ter didaktične metode in postopki, ki so temeljili na avtentičnem učenju.

DIDACTIC GAMES IN CHEMISTRY LESSONS
/
DIDAKTIČNE IGRE PRI POUKU KEMIJE

Jasmina Kolbl

OŠ Radenci

jasmina.kolbl@guest.arnes.si

ABSTRACT

It is almost impossible to imagine teaching chemistry without experimental work. However, using experimental work in some chapters can be almost impossible. Therefore teachers use and help ourselves with didactic games. In this way learners are able to acknowledge the field of reaction chemistry and get excited over chemistry, develop logical thinking and realize, that chemistry is not a dull science and that you can enjoy solving chemistry exercises, get to think and except chemistry in a different way. In the following contribution the didactic games, appropriate for chemistry lessons, are presented in detail.

Keywords: *motivation, didactic games, chemistry.*

UVOD

Ob spoznanju, da je dejanska sprostitev v razvoju in življenju današnjega človeka nepogrešljiva, z didaktičnimi igrami učencem omogočimo, da menjajo svojo obvezno obremenjujočo dejavnost z rekreativnimi in sprostitvenimi dejavnostmi. Skozi igro učenci urijo motorične spretnosti, hitrost odzivanja, usklajenost vida in gibanja, zavedanje lastnega telesa, vidno, slušno in tipno zaznavanje. Čeprav so didaktične igre, ki sem jih izbrala, namenjene uporabi pri pouku kemije, pa obenem učenci razvijajo govor, bogatijo besedišče in širijo splošno poučenost.

METODA

Za izdelavo kvalitetnih didaktičnih iger potrebujemo veliko slikovnega gradiva, ki ga je pogosto treba še oblikovati. Delo z računalnikom je torej neizogibno. Za daljšo življenjsko dobo didaktičnih iger (predvsem letakov in drugih, natisnjenih na papir) je le-te dobro plastificirati. Vendar dandanes ob uporabi tehnologije (elektronska tabla v povezavi z računalnikom) lahko pripravimo didaktične igre kar v ustreznem računalniškem programu in se izognemo preveliki porabi papirja in ostalih pripomočkov.

REZULTATI

Primeri didaktičnih iger: Spomin (Organske kisikove spojine, 9.r), Domine (PSE, 8.r) in Tombola (Splošna in organska kemija, 8.r).

	propanol		etil metil eter

propan-2-ol		Dimetil eter

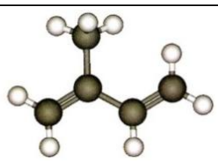
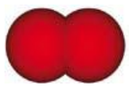
	V PS so elementi razvrščeni v Ž	skupine in periode.	Elementi so razvrščeni v skupine glede na L
število elektronov v zunanji lupini	ter v periode, v katerih se A	veča število elektronov v isti lupini.	Elementi v isti skupini imajo H
podobne kemijske lastnosti.	Elektrone zunanje lupine v atomu imenujemo T	valenčni elektroni.	Elementi so v PS po skupinah razvrščeni v N
navpične stolpce,	po periodah pa v I	vodoravne vrste.	Poleg 8 glavnih skupin PS posebno mesto v PS zavzemajo še P
stranske skupine (prehodni elementi),	pri katerih se z naraščajočim vrstnim številom polnijo L	orbitale d.	Več kot ¾ elementov so I
kovine s posebnimi fizikalnimi in kemijskimi lastnostmi.	Preostalo so N	nekovine, polkovine in žlahtni plini.	 I

Primer didaktične igre 2: Domine



Primer didaktične igre 3: Tombola

ZAKLJUČEK

Pogoj za uspešno delo pri uporabi didaktičnih iger je, da ima učitelj pripravljene zbirke iger z navodili za uporabo. Še posebej moramo upoštevati načelo podajanja navodil. Ta morajo biti jasna in razumljiva vsem otrokom. V sproščenem in ustvarjalnem ozračju sta potem zadovoljna oba: učitelj in učenec.

THE PLANT PROTECTION PRODUCTS BY THE METHOD OF PROJECT COOPERATIVE WORK
/
FITOFARMACEVTSKA SREDSTVA Z METODO PROJEKTNO SODELOVALNEGA DELA

Stana Kovač Hace

Srednja šola Zagorje

kovachace@gmail.com

ABSTRACT

At the Secondary school Zagorje we often perform project cooperative work which includes some professors and all students of a class. The topic Plant Protection Products is presented by the method of project cooperative work. The set goals were accomplished in the following subjects: Chemistry in Profession (Health care, open curriculum), Slovenian, English, Health care and Professional terminology (Latin). The emphasis was on active methods and forms of work. This type of work enabled students to develop different competences (ICT, learning to learn, social skills) as well as opportunities for cooperative work and the competence of health protection.

Keywords: *project cooperative work, active methods, integrated competences*

UVOD

Na šoli tretje leto izvajamo prenovljene programe, zato v svoje delo oziroma v delo dijakov vključujemo nove metode dela, kot so projektno–sodelovalno delo, medpredmetne integracije, projektni dnevi, kamor vključujemo tudi integrirane kompetence.

V prispevku bo predstavljen primer medpredmetnega pristopa pri obravnavi tematskega sklopa Fitofarmacevtska sredstva z metodo projektno sodelovalnega dela. Dijaki so pri tem realizirali cilje predmetov: kemija v stroki (zdravstvena nega, odprti kurikul), slovenščina, angleščina, zdravstvena nega in strokovna terminologija (latinščina).

Pri projektno–sodelovalnem delu je bil poudarek na aktivnih metodah in oblikah dela. V ospredju je bila vloga kemije za zdravje, varnost in okolje. Pri delu so dijaki eksperimentirali, analizirali, pisali zaključke, argumentirali ter bili sposobni vključevati refleksijo o svojih dosežkih. S takšnim delom so dijaki osvojili kemijske pojme na primerih, ki se navezujejo na njihov poklic, prav tako pa so razvijali poklicne kompetence. S takšnim načinom dela se pri dijakih poveča razumevanje kemijskih pojmov. Cilj takšnega načina dela je, da so dijaki sposobni združiti znanje različnih področij, predvsem s poklicnim delom. Takšno znanje je osnova za razumevanje in nadgradnjo strokovno-teoretičnih predmetov ter za vseživljenjsko učenje.

Dijaki so pri tem načinu dela razvijali tudi IKT kompetenco, kompetenco učenje učenje, kompetenco socialnih veščin – razvijajo zmožnosti za sodelovalno delo ter kompetenco varovanja zdravja.

Profesorice šestih predmetov smo se povezale v projektno delo, izdelale skupno pripravo ter načrt dela, pri tem je bila kemija v stroki nosilni predmet.

METODA

Profesorice smo izdelale skupno pripravo in načrt dela. Prvo uro smo dijakom predstavile pravila, dijake razdelile v sedem skupin, v sklopu katere je vsaka dobila svojo temo, natančna navodila o poteku dela in pričakovanem izdelku oz. rezultatu dela (PPT predstavitev, film, v katerem so zajeti zaključki, ugotovitve, komentarji ter predstavitve, potek in rezultat eksperimentalnega dela). V naslednjih osmih urah so dijaki sami pripravili načrt dela, s katerim so določili zadolžitve posameznim članom skupine. Člani so v skupini predlagali ideje, zbirali ustrezno literaturo ter sestavili in oblikovali izdelek, ki so ga oddali profesoricam v pregled. Zadnji dve uri je sledila predstavitev dela skupin učiteljskemu zboru. Projekt je potekal štirinajst dni pri vseh predmetih, ki so sodelovali pri projektno-sodelovalnem delu.

REZULTATI

Po predstavitvi smo napravili evalvacijo, kjer smo naprej ocenjevale profesorice, sledilo pa je še samoocenjevanje dijakov (ocenjevalna lista sta bila identična). Primerjale smo število točk dijakov s številom točk profesoric. Ocenjevali smo področja: informiranje, reševanje problemov, podjetnost, komunikativnost in samoorganiziranost.

Primerjava ocene dijakov z ocenami profesoric je pokazala, da se dijaki, ki so pri pouku uspešnejši, ocenjujejo slabše, so do sebe bolj kritični in manj samozavestni, kot dijaki, ki so pri pouku manj uspešni. Izziv profesorjev je, da motiviramo in spodbujamo dijake, ki so zelo kritični do sebe, da v času šolanja postanejo samozavestni in zaupajo vase. Tisti dijaki, ki so premalo samokritični, pa morajo v času šolanja priti do spoznanja, da le veliko truda in treninga vodi do želenih rezultatov.

Izkušnje takšnega načina dela kažejo, da so dijaki bolj motivirani za delo, tudi znanje, ki sem ga ocenjevala na pisnem preverjanju, je bilo boljše.

ZAKLJUČEK

Ugotavljam, da je takšen način dela za dijake smiselen, saj dijaki dosegajo boljše rezultate. Pri pouku so aktivni, med seboj komunicirajo, se naučijo poslušati ostale v skupini, delijo svoje mnenje z drugimi, razvijajo spretnosti predstavljanja svojega dela ter so sposobni kritičnega vrednotenja svojega dela ter dela drugih. Izkušnje so pozitivne, zato bomo s takšnim delom na šoli nadaljevali.

USAGE OF ELECTRONIC LITERATURE AND INFORMATIONAL COMMUNICATIVE TECHNOLOGY(ICT) AT CHEMISTRY CLASSES
/
UPORABA E-GRADIV IN IKT TEHNOLOGIJE PRI POUKU KEMIJE

Karmen Krašna Otrin

Šolski center Rudolfa Maistra Kamnik

karmen.krasna@guest.arnes.si

ABSTRACT

With the help of electronic literature, ICT and interactive blackboard, we managed to get across learning unit ˝Constant of acids and bases˝. The preparation and realization of lessons were held in a slightly different, a little more extraordinary way as usual. One of the lessons was held in computer classroom, and the second lesson in a specialized classroom with electronic interactive blackboard. During the first lesson, students had to solve a few tasks from electronic literature. During this lesson their notebooks were not required, but it did require a more comprehensive preparation for the teacher. Electronic literature matches with the existent learning program quite well and it is also preferred by the students.

I also used this e-literature for teaching new chapters in learning unit ˝Constant of acids and bases˝, at which I had to take into consideration the students' previous knowledge, which they had acquired in the chapter ˝Balance in water solutions˝. During the third lesson, students had to find some animations, in connection with the current learning unit, on the internet. Each of them than had to prepare at least two questions, which were then used in power point presentation.

Keywords: *interactive blackboard, constant of acids and bases, electronic literature*

UVOD

V svoji predstavitvi bom podrobno opisala pripravo in izvedbo treh učnih ur z uporabo e-gradiv in IKT tehnologije. Tema je bila izbrana iz poglavja »Ravnotežje v vodnih raztopinah«, učna enota pa je »Konstanta kislin in baz«.

METODA

Pri izvedbi treh učnih enot z uporabo e-gradiv bi poudarila aktivno vlogo dijakov kot tudi učitelja. Dijaki so v prvi uri v računalniški učilnici reševali probleme iz e-gradiv v okviru ponovitve predhodne snovi. Druga ura je potekala v učilnici za kemijo z interaktivno tablo, pri čemer so dijaki aktivno sodelovali. Uporabila sem program PowerPoint 2003 na interaktivni tabli, kjer sem opombe in komentarje sproti vnašala z elektronskim pisalom. Iz slikovnega gradiva (mikro nivo) smo razvrstili kisline in baze na močne in šibke. Jakost kislin in baz smo določili s pomočjo vrednosti K_a in K_b. Pomagali smo si s stolpičasto in grafično animacijo v gradivu. Zapisali smo razlike med močnimi in šibkimi elektroliti, naučili smo se zapisa za konstanto K_a in K_b.ter stopnjo protolize šibkih kislin in baz. Tretja ura je potekala ponovno v računalniški učilnici. Delo je potekalo v dvojicah. Vsak par je pripravil dve vprašanji in jih predstavil v PowerPoint-u.

REZULTATI

Ta način dela zahteva nenehno spremljanje dijakove aktivnosti, kajti le tako se lahko ugotovi, če dijaki vsebino razumejo. Pri tem mislim na del, ki poteka v računalniški učilnici. Učna enota »Konstanta kislin in baz« je s pomočjo e-gradiva in interaktivne table bolj nazorna in razumljiva ter bolje pojasni običajno težko predstavljive pojme. Dijakom je ta način dela blizu in to lahko počnejo tudi doma.

ZAKLJUČEK

Delo z računalnikom je bilo za dijake zanimivo in prijazno. Za učitelja pomeni to večjo aktivnost v šoli in tudi doma. Pomanjkljivo pa je to,da računalniške učilnice niso vedno na razpolago. V bodoče bi lahko razmišljali o medpredmetni povezavi kemija – informatika, ali pa o dodatni opremljenosti učilnic za kemijo. Vsi dijaki pa niso enako motivirani, zato nekateri ne sodelujejo. Za večino dijakov pa je bil ta način dela zanimiv in rekli so da je napreden. Pri izvajanju pouka je potrebno biti precej inovativen, da motiviraš čim večje število dijakov.

COOPERATIVE PROJECT WORK IN CHEMISTRY CLASSES AT SECONDARY SCHOOL LEVEL / SODELOVALNOPROJEKTNO DELO PRI POUKU KEMIJE V GIMNAZIJI

Darja Kravanja

II. gimnazija Maribor

darja.kravanja@gmail.com

ABSRTACT

In today's fast changing world it is very important that pupils at schools develop abilities for responsible and active cooperation in problem solving. This can be achieved with the method of cooperative project work which was introduced in chemistry classes at secondary school level as an integral part of the learning process. This article deals with the introduction of cooperative project work in chemistry classes based on three units in three school years. In developing cooperative project work the role of a teacher as a planner of challenging tasks and monitoring the work is also shown as well as different methods of evaluation of pupils' work and their products.

Keywords: *cooperative project work, chemistry, secondary school*

UVOD

V času hitrih sprememb na vseh področjih življenja so tudi zahteve po znanju različnih vsebin in veščin drugačne. Naloga šole je, da učence pripravi na življenje v takem svetu, zato se je pojavila potreba po spremembi učnih načrtov.

V gimnazijskem programu ima kemija vlogo splošnoizobraževalnega predmeta, ki temelji na problemsko naravnanem pouku in raziskovalnem pristopu. Poleg razvijanja naravoslovno-matematične kompetence morajo dijaki razvijati odnosne in odločitvene zmožnosti, kot je sposobnost za odgovorno in aktivno sodelovanje pri razreševanju problemov. To pa lahko razvijamo v obliki sodelovalnoprojektnega dela, ki smo ga začeli uvajati s posodobljenim učnim načrtom.

METODA

Uvajanje sodelovalnoprojektnega dela je prikazano kot metoda učenja pri pouku kemije oziroma kot proces pri treh učnih sklopih skozi tri šolska leta.

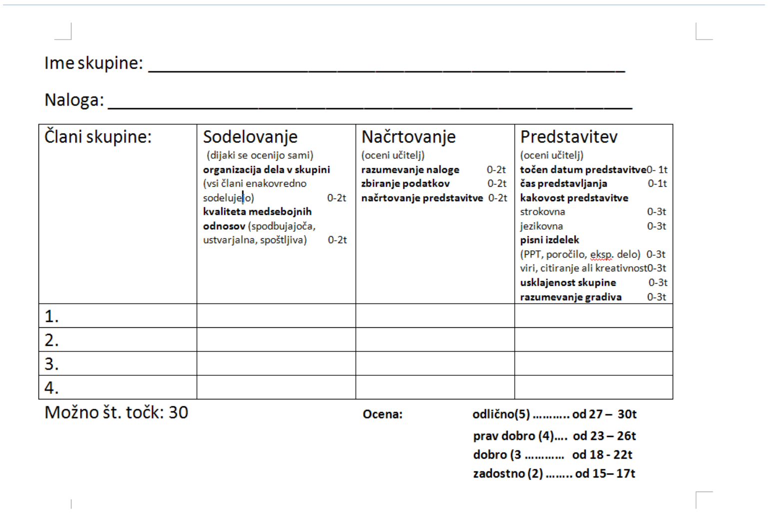
Prvo leto je namenjeno spoznavanju sodelovalnega pristopa pri učnem sklopu Alkalijske kovine in halogeni. Za delo je predvidenih 8 ur. Prva ura je namenjena tvorjenju skupin in spoznavanju načina dela skupine, izgrajevanju zaupanja in povezanosti v skupini s pomočjo različnih didaktičnih iger. Sledi aktualizacija teme z motivacijskimi članki in delovnimi listi, nato pa usvajanje s samostojnim delom skupin. Delo se zaključi z utrjevanjem in preverjanjem znanja ob poročanju skupin ter z demonstracijskim prikazom eksperimentov. Gre za vodeno pripravo na projektno delo, s katerim se srečajo naslednje šolsko leto. Dijaki v skupinah s pomočjo pripravljenih gradiv in skozi različne aktivnosti usvojijo cilje zapisane v učnem načrtu. Učitelj ima pri sodelovalnem delu vlogo organizatorja, povezovalca in kritičnega opazovalca. Skrbno mora pripraviti gradivo, da doseže vse zastavljene cilje v predvidenem času. Dijake mora tudi seznaniti z načinom vrednotenja njihovega dela in znanja. Del odgovornosti pri ocenjevanju nosijo tudi dijaki sami, ki ovrednotijo sodelovanje v skupini – organizacijo dela v skupini in medsebojne odnose (približno 5 % pridobljene ocene.) Učitelj pa oceni načrtovanje in predstavitev skupin oz. posameznih članov skupine.

V drugem letu se dijaki soočijo s sodelovalnoprojektnim delom pri učnem sklopu Lastnosti izbranih elementov in spojin v bioloških sistemih ter sodobnih tehnologijah. Dijaki morajo v sodelovanju rešiti preproste probleme iz vsakdanjega življenja. Primeri: Pridobivanje pomembnih kovin in rud, Uporaba anorganskih spojin v življenju oz. Elementi in njihove spojine v modernih tehnologijah. Sklopu je namenjenih 10 ur od predstavitve pričakovanih dosežkov, preko samostojnega iskanja informacij, samostojnega načrtovanja laboratorijskega dela, do javne predstavitve dela in ocenjevanja izdelkov dijakov. Učitelj mora skrbno pripraviti uravnotežene problemske naloge in izdelati načrt za ocenjevanje izdelkov, organizacijo in načrtovanje dela ter del odgovornosti za ocenjevanje pa prepusti dijakom.

Tretje leto dijaki utrjujejo svoja znanja in veščine o zgradbi in lastnosti izbranih organskih spojin na ta način, da dobijo kompleksni problem, ki ga morajo skupaj razrešiti. Pri tem si morajo sami razdeliti delo, tako da vsak posameznik enakovredno prispeva k rešitvi problema. Čas pouka je namenjen zgolj predstavitvi dela in izdelkov ter ocenjevanju izdelkov. Primer takšnega razrednega projekta je Priprava zdravega obroka (spoznati sestavine, zdravilne učinkovine, dokazovanje teh snovi, energetska vrednost …).

REZULTATI

Izdelani so bili učni listi, motivacijski članki, navodila za laboratorijske vaje in didaktične igre za sodelovalno delo pri proučevanju lastnosti in nahajališč alkalijskih kovin in halogenov v vsakdanjem življenju, prav tako je bil izdelan obrazec za ocenjevanje.



Ime skupine: ______________________________

4.			

Možno št. točk: 30

Ocena: **odlično(5) ……….. od 27 – 30t**
prav dobro (4)…. od 23 – 26t
dobro (3 ………… od 18 - 22t
zadostno (2) …….. od 15– 17t

Slika 1: Ocenjevalni obrazec

Izdelane so bile problemske naloge z navodili in projektna naloga z navodili Opravljena je bila tudi evalvacija znanja dijakov, ki je pokazala, da so dijaki s sodelovalnoprojektnim delom nadgradili svoja znanja, ki so jih pridobili pri obravnavanju drugih učnih sklopov. Bolje razumejo soodvisnost zgradbe, lastnosti in uporabe snovi ter razumejo naravne procese. Na primerih dokazujejo, da so sposobni samostojno načrtovati eksperimentalno delo, poiskati, obdelati in kritično vrednotiti zbrane informacije, uporabljati strokovno kemijsko terminologijo ter reševati preproste oz. kompleksne probleme iz vsakdanjega življenja. Z javno predstavitvijo svojega dela dokazujejo medosebno kompetenco in veščine javnega nastopanja.

ZAKLJUČEK

Sodelovalno projektno delo pripelje do kakovostnejšega znanja dijakov. To pa ne pomeni tudi znanja več informacij, ker so le-te lahko že zastarele, ko zapustijo šolo. Pomeni, da se dijaki naučijo strategij in postopkov za reševanje problemov z veščinami, ki se nanašajo na miselne procese, naučijo se iskanja novih informacij, analize, sinteze in vrednotenja, ob enem pa razvijajo odnosne in odločitvene zmožnosti.

AN EXAMPLE OF EMPIRICAL LEARNING IN RECOGNIZING THE CARAUSIUS MOROSUS / PRIMER IZKUSTVENEGA UČENJA OB SPOZNAVANJU PALIČNJAKA

Irena Kresevič

OŠ Rudolfa Ukoviča Podgrad

ikresevic@gmail.com

ABSTRACT

The article presents an example of empirical learning in the science field. The author of the article performed the project with the second grade pupils. The aim of the project is recognizing a less known animal – a carausius morosus and its life habitat, and therefore developing a positive relation to the animal. The pupils reveal and recognize the characteristics of live creatures and their life habitats by direct sistematic watching of and care for them. The author states that the pupils have recognized basic life needs of the carausius morosus, have softened fear of the unknown, have used their ante-knowledge and experiences, have developed their communicative abilities, healthy personal releationships and positive self-image spontaneously.

Keywords: *empirical learning, live creatures, carausius morosus, individual experience, science.*

UVOD

Otrok je po naravi vedoželjno bitje. Ko spozna okolico, se usmeri k tistemu, kar je zanj neznano. Naloga učitelja je, da učenca vodi in usmerja k pridobivanju novih neposrednih izkušenj ter ga spodbuja k raziskovanju novega. Z uporabo elementov konstruktivističnega pristopa pri učenju in poučevanju začetnega naravoslovja, torej z aktivnim vključevanjem učencev v različne konkretne naravoslovne dejavnosti, učitelj vodi učence do boljše naravoslovne pismenosti.

Z učenci drugega razreda sem izvedla dejavnosti na temo Spoznajmo paličnjaka. Dejavnosti so potekale dva tedna. Cilji, ki sem jih želela uresničiti so bili, da učenci: spoznavajo paličnjaka in njegovo življenjsko okolje; oblikujejo pozitiven odnos do živih bitij in narave; spoznavajo in začutijo, da obstaja komunikacija med človekom in živaljo, premagajo strah pred paličnjakom; razvijajo sposobnosti za lastno raziskovalno delo in usvajanje postopkov: opazovanje, razvrščanje, merjenje, eksperimentiranje, raziskovanje, sporočanje; razvijajo zdrave medosebne odnose in pozitivno samopodobo.

Razmišljanja, kako realizirati zastavljene cilje, so me pripeljala do sklepa, da moram učencem omogočiti neposredno izkušnjo, stik z živim bitjem - paličnjakom, ki bi ga učenci lahko spoznali in začutili z vsemi svojimi čutili.

METODA

Razmišljanja, kako naj učenci spoznajo paličnjaka, so me pripeljala do odločitve, da bi, paličnjaka opazovali v naši učilnici. Zato sem v učilnico prinesla kozarec, v katerem sta bila poleg zelenih listov robide tudi dva paličnjaka. Zavedala sem se, da so učenci še neizkušeni in neiznajdljivi, zato je še toliko bolj pomembno, kako jih bom vodila skozi dejavnosti. Za začetek sem pripravila nekaj vprašanj za učence (Kaj opazite v kozarcu? Se kaj premika? Opazite kaj nenavadnega? Katero žival opazite v kozarcu? Zakaj se tako imenuje? Zakaj je nismo takoj opazili? Bi jo želeli spoznati? Jo želi kdo prijeti?...).

V knjižnici smo poiskali ustrezno literaturo, ki pa je je bilo zelo malo. Po navodilih smo v stekleni posodi pripravili gojilnico. Učenci so paličnjaka poimenovali, opazovali vsak dan in vodili dnevnik opazovanja, v katerega so sproti beležili opažanja. Vsak dan so najprej opazovali paličnjaka v gojilnici, nato so ju postavili na klop in jima dovolili, da sta se premikala po njihovih rokah. Nihče ni nikogar silil, naj prime paličnjaka. Vsak je prvi korak napravil takrat, ko je sam čutil, da je na to pripravljen, da to zmore in si želi. Ostali so bili veseli vsakogar, ki se jim je pridružil. Mislim, da je deklica (drugače zelo zadržana), ki je zadnja prijela paličnjaka, premagala samo sebe in bila tudi zaradi tega zelo zadovoljna. Učenci so hranili, opazovali in primerjali obliko, barvo, velikost, gibanje, značilnosti ter posebnosti paličnjaka. Ob vsakodnevnem opazovanju sem učencem zastavljala akcijska (produktivna) vprašanja (Kaj? Iz česa je? Kako? Koliko? Kaj je skupnega? V čem se razlikujeta? Kaj se zgodi, če…? Kaj misliš, zakaj…?... s katerimi sem želela spodbuditi dejavnosti in razmišljanje učencev.

V tem času so učenci izvedli še nekatere dejavnosti drugih predmetnih področij, s čimer so, tako dejavnosti kot zastavljene cilje, medpredmetno povezovali. Že prvi dan so učenci odgovarjali na vprašanja o paličnjaku. S tem sem želela ugotoviti, kaj učenci znajo o tej živali. Paličnjaka so tudi risali. S ključem za določanje živali so ugotovili, da je to žuželka, kar so morali utemeljiti. Navedli so tri razloge, zaradi katerih so ga uvrstili v razred žuželk. Učenci so dobili nalogo: V času, ko smo spoznavali paličnjake, je tvoj sošolec manjkal pri pouku. Napiši, kaj si se o paličnjaku naučil, da se bo iz tega kaj naučil tudi on. V gibalni igri so posnemali paličnjaka v različnih razmerah (hodi, se prikrije, raziskuje,..). Pri likovni vzgoji so paličnjake naslikali. Nastali so zelo zanimivi izdelki. Nekateri učenci so na plakat narisali paličnjaka ter vpisali njegove dele telesa. Druga skupina je oblikovala miselni vzorec o paličnjaku. V zaključku so učenci ponovno odgovarjali na ista vprašanja kot v uvodnem delu. Odgovori so bili bistveno boljši.

Paličnjaka smo v učilnici obdržali še kar nekaj časa. V tem času sta znesla jajčeca iz katerih so se izlegli mladi paličnjaki. Tisti učenci, ki so želeli so paličnjake odnesli domov, kjer so zanje skrbeli in nam poročali o spremembah, ki so jih opazili pri svojih paličnjakih.

REZULTATI

Zastavljeni cilji so bili realizirani. Spoznavanje paličnjaka je bilo za otroke prav posebna in zelo zanimiva pozitivna izkušnja. Tudi sama sem z zanimanjem opazovala učence, s kako veliko vnemo so se lotili danih nalog in vztrajali do konca. Samo dva učenca sta paličnjaka videla že prej. Ker je bilo literature na to temo zelo malo, so bili prisiljeni se učiti z zelo natančnim in sistematičnim opazovanjem. Preko konkretnih aktivnosti so spoznali telesno zgradbo žuželke in funkcije njenih delov telesa, nekatere posebnosti paličnjaka, kot so: pojav prikrivanja - z obliko, barvo in vedenjem posnema rastline; ob nevarnosti zloži vse okončine tesno ob telo in negibno obleži, tudi več ur – katalepsija; paličnjak je običajno nočna žival; se levi; razmnožuje se z neoplojenimi jajčeci - partenogenetsko; ima zelo krhke noge, ki se hitro zlomijo, a kmalu zrastejo na istem mestu nove.

Učenci so odpravili, ali vsaj omilili, strah pred paličnjakom in nekaterimi drugimi nenevarnimi malimi živalmi. Začutili so, da obstaja pozitivna in negativna komunikacija s paličnjakom, če z njim lepo ravnamo, nam to tudi vrača. Spoznali so, da ima paličnjak svoje življenjske potrebe, da vsa živa bitja umrejo in se po smrti razgradijo. Spremenili so odnos do živali v naravi in spoznali, da ima vsako živo bitje svojo pomembno vlogo pri ohranjanju ravnovesja v naravi. Usvojili so novo izrazoslovje in z vsem tem prispevali k boljši naravoslovni pismenosti.

ZAKLJUČEK

Spremljanje praktičnega dela in analiza izdelkov učencev, ki so nastali med samimi dejavnostmi in ob preverjanju zastavljenih ciljev sta pokazala, da so učenci prišli do pomembnih spoznanj o paličnjaku. Z novimi izkušnjami so dopolnili in obogatili mnoge nejasne predstave o majhnih živalih, dopolnili svoje predznanje ter določena dejstva posplošili na vsa živa bitja Zelo pomembno je tudi, da so nekateri učenci premagali strah, ki so ga čutili do nekaterih malih živali in pridobili pozitiven odnos do le teh.

EFFECT OF COOPERATIVE LEARNING IN BIOLOGY CLASS
/
UČINEK SODELOVALNEGA UČENJA PRI POUKU BIOLOGIJE

Lucija Lah

OŠ Šenčur

lucija.lah@guest.arnes.si

ABSTRACT

In our study we have checked the following hypotheses: cooperative learning is comparable to traditional learning, the knowledge acquired by cooperative learning lasts longer and the relations among pupils are improved. We performed a research which included 145 7-grade pupils, subject »natural science«. We chose three content-similar ecological themes (Forest, Ground and Continental Waters) which were treated by cooperative (the jigsaw method) and traditional learning. The statistical analysis of the results shows that knowledge acquired by cooperative learning is comparable to the knowledge acquired by traditional learning (also in terms of its durability) and that relations among pupils are improved.

Keywords: *cooperative learning/tradicional learning/biology/ecology/jigsaw*

UVOD

Ljudje smo socialna bitja, življenje v skupnosti in intenzivna interakcija z drugimi ljudmi je pogoj za naš razvoj in udejanjanje naših potencialov. Odnosi z drugimi so pomembni v vseh življenjskih obdobjih od najzgodnejšega obdobja v družini, kasneje v vrtcu, v šoli, skupinah vrstnikov, v partnerskih odnosih in na delovnem mestu. Kvaliteto teh odnosov in s tem uspešnost v življenju pa v veliki meri določa naše sodelovanje z ljudmi, ki nas obkrožajo.

Sama sem učiteljica biologije, naravoslovja in gospodinjstva v osnovni šoli. Pri učencih sem opazila, da imajo težave s sporazumevanjem med seboj in tudi z mano. Veliko se prepirajo, nekateri pa so popolnoma izolirani od drugih učencev. Pri ustem preverjanju in ocenjevanju znanja opažam, da nekateri učenci snov sicer razumejo, vendar imajo probleme pri izražanju. Rezultati nas ne bi smeli presenetiti, saj imajo učenci le malo možnosti za pogovor. S starši se pogovarjajo le malo, saj so le-ti dolgo časa v službah, med poukom učenci ne smejo klepetati, ko pridejo domov se usedejo pred računalnik ali pa pred televizijo.

»Sodelovalno učenje je učenje v majhnih skupinah, ki je strukturirano tako, da med člani skupine obstaja pozitivna soodvisnost, ko skušajo s pomočjo neposredne interakcije v procesu učenja doseči skupen cilj, pri tem pa se ohrani tudi odgovornost vsakega posameznega člana skupine« (Peklaj, 2001, str. 9).

METODA

Prvo hipotezo bomo potrdili oziroma ovrgli s preverjanjem znanja pri pouku naravoslovja v sedmem razredu devetletke, kjer so blok ure in je to še bolj ugodno za tak način dela.

Poučujem tri razrede s skupaj 80 učencev. Trikrat bomo ponovili poizkus tako, da bomo obravnavali novo snov s sodelovalnim učenjem v dveh razredih, tretji razred, pa bo kontrolna skupina in bo snov predelal s tradicionalnim učenjem. Kontrolna skupina bo vedno drug razred.

Ves postopek bomo ponovili še v naslednjem šolskem letu z naslednjo generacijo učencev, da bo število učencev večje in tako rezultati bolj realni. Skupno število vseh učencev, ki bodo sodelovali v raziskavi, bo tako 145.

Hipotezo, da je znanje pridobljeno s sodelovalnim učenjem trajnejše, kot znanje pridobljeno s tradicionalnim učenjem, bomo preverili s ponovnim preverjanjem znanja čez daljši čas (po šestih mesecih).

Hipotezo, da se odnosi med učenci v skupini z metodo sodelovalnega učenja izboljšajo, da se jim poveča želja po sodelovanju s sošolci in tudi priljubljenost učencev v razredu, bomo preverili z vprašalnikom, kjer bodo učenci izrazili svoje mnenje o sodelovalnem učenju in o vplivu takega načina dela na njihovo medsebojno razumevanje ter s socimetrično preizkušnjo pred in po delu z metodo sodelovalnega učenja.

Poskus smo izvajali pri skupno 42 šolskih urah, pregledali pa smo okoli 700 preizkusov znanja, 80 anket in 150 sociometričnih preizkusov. Prosojnice in primere organizmov smo pokazali vsem, tako pri tradicionalnem, kot pri sodelovalnem učenju.

REZULTATI

Postavili smo hipotezo, da med učenci, ki se učijo z različnima metodama učenja ne obstajajo razlike v rezultatih na preizkusih znanja. Na podlagi rezultata potrdimo hipotezo.

Testirali smo hipotezo, da je znanje sodelovalnega učenja pri populaciji trajnejše od tradicionalnega. V ta namen smo rezultate pri posameznih temah prve generacije, ki so preverjali znanje dvakrat med seboj odšteli, da bi ugotovili, kakšna je absolutna razlika med prvim in drugim preverjanjem. Populacijo smo nato razdelili samo glede na učenje (tradicionalno ali sodelovalno). Na podlagi rezultata hipotezo ovržemo.

Pokazati smo želeli, da so se odnosi v skupini z metodo sodelovalnega učenja izboljšali. To smo izmerili tako, da smo med seboj primerjali rezultate pred in po izvajanju sodelovalnega učenja, seveda posebej za prejete in oddane glasove. Ker smo pričakovali, da so se odnosi izboljšali, samo od prejetih (oddanih) glasov po izvajanju sodelovalnega učenja odšteli prejete (oddane) glasove pred izvajanjem sodelovalnega učenja. Če sodelovalno učenje ne bi imelo nikakršnega vpliva na rezultate, potem bi bila razlika enaka nič. V primeru, da so se rezultati izboljšali (naša hipoteza), pa je razlika pozitivna.

ZAKLJUČEK

Pozitivne socialne posledice sodelovalnega učenja so pomembne predvsem, ko je eden od ciljev izobraževanja tudi vključitev otrok, ki so pripadniki drugih ras, nacionalnosti ali pa otrok s posebnimi potrebami.

Nesprejemanje kakorkoli drugačnih otrok v šoli je sedaj še posebej pereč in aktualen problem. Zato predlagam, da večkrat uporabimo tudi sodelovalno učenje, saj smo dokazali primerljive rezultate s tradicionalnim načinom učenja v preizkusih znanja in v trajnosti znanja, pomembno pa so se izboljšali odnosi med učenci. Naredili bi lahko še prej omenjene izboljšave in proučili še učinek le-teh. Seveda bi bili rezultati še bolj zanesljivi, če bi bilo število učencev večje. Zanimivo bi bilo narediti raziskavo tudi pri predšolskih otrocih, na srednjih šolah, pa tudi na fakulteti med študenti.

A SYSTEMATIC APPROACH TOCLASS BIOLOGY TEACHERS TO COPE WITH STRESS AT SCHOOL / SISTEMATIČNI PRISTOP UČITELJA K POUKU BIOLOGIJE ZA LAŽJE OBVLADOVANJE STRESA V ŠOLI

Sabina Lepen Narić

Gimnazija Jožeta Plečnika Ljubljana

inaprofbio@gmail.com

ABSTRACT

In his contribution to the case showed how a teacher of biology, despite the teeming masses of information, the expected goals, daily appointments and obligations, systematic approaches to teaching and its regularized, with as little stress contributes to systematic knowledge acquisition in general high school biology.

Contribution offers teachers of biology, which for various reasons, can not find the time, formal, mandatory lesson preparation. Teachers provide an overview of the learning objectives of individual lessons and gradual ownership of new concepts. It also proposed a form and method of work for each lesson. Further assistance has made teacher ppt presentations on specific topics and individually designed worksheets and tests for examinations.

Keywords: *educational preparation, virtual classroom, ppt presentations, control of stress in the learning process*

UVOD

V nastajajočem didaktičnem priročniku bodo učitelji našli učne priprave za vseh 70 ur biologije v vseh treh letnikih, kar znaša blizu 210 priprav. V tokratnem prispevku je predstavljena le ena od 210 priprav na učno ure biologije.

Izdelane učne priprave (Tabela 1) lahko učitelj poljubno spreminja, dograjuje oziroma jih sproti prilagaja in bogati. Lahko pa si na podlagi ideje izdela povsem nove priprave. Kljub temu ima možnost prihranka dragocenega časa in energije, saj mu ponujam okviren osnutek priprave. V veliko pomoč je lahko učiteljem začetnikom ali pa starejšim učiteljem, ki še niso tako vešči moderne informacijske tehnologije.

METODA

V učno pripravo (Tabela 1) lahko poljubno vnašajo razred, datum in leto poučevanja, izbirajo med metodami in oblikami dela, med učnimi pripomočki oz. sredstvi poučevanja. V posebno rubriko lahko vnesejo literaturo, ki jo uporabljajo pri pouku. V posamezno učno pripravo so že vneseni učni cilji iz posodobljenega učnega načrta ter novi pojmi, obravnavani pri posamezni uri. Učne cilje lahko po lastni presoji zamenjajo, premestijo ali pa enostavno izbrišejo. Za posamezno učno uro je že predlagana uvodna motivacija, glavni del ure in zaključek, skupaj z okvirno časovno razporeditvijo dela. V glavnem delu ure je zapisan vsebinski, teoretični del, ki učitelja spomni, kaj vse mora obdelati v tej uri. S ppt prezentacijo dijaku omogoči lažje razumevanje učne vsebine, saj elektronske prosojnice vsebujejo veliko slikovnega materiala. Biologija je predmet, ki ga je nujno potrebno razlagati ob slikovnem gradivu. Tudi ppt predstavitvijo lahko učitelj poljubno spreminja in prilagaja. V rubriki delo dijakov je navedeno, kakšne zadolžitve imajo dijaki tekom učne ure in domače delo. Zavedena so tudi mesta v obstoječi literaturi, kjer lahko dijaki usvojijo in utrdijo ter nadgradijo v uvodu navedene cilje. Učnim pripravam so dodani tudi delovni listi za utrjevanje učne snovi in testi za preverjanje znanja. Ker pa uporabljamo tudi spletno učilnico sem predstavila eno izmed možnih poti za ureditev izobraževanja posameznih skupin oz. razredov.

Dijaki si lahko preko spletne učilnice doma še enkrat ogledajo ppt prosojnice, saj med poukom nimajo časa prepisovati, slikovno gradivo pa je seveda potrebno večkrat pogledati in preučiti. Še posebno je v veliko pomoč spletna učilnica odsotnim dijakom, ki iz različnih vzrokov ne morejo biti pri pouku. Učitelj lahko objavi v spletni učilnici tudi priprave, tako so dijaki sproti seznanjeni s cilji in ostalimi komponentami učne ure.

MENDLOV ZAKON:razlaga s pomočjo ppt prezentacije , objavljene v spletni učilnici ECHO*(www.egradiva.si)*** Opazujemo dedovanje dveh lastnosti oz. dveh genov. Če križamo med seboj homozigotne starše za obe lastnosti (P), nastane v F1 generacija samo ena vrsta potomcev (100% enaki heterozigoti). Če sta gena za obe lastnosti na različnih kromosomih in se med mejozo razporejata neodvisno drug od drugega, nastajajo štiri različne gamete. Pričakovano razmerje fenotipov in genotipov v F2 generaciji lahko prikažemo z Punnettovim kvadratom (rekombinacijski kvadrat).To razmerje je 9:3:3:1. **Zaključno ponavljanje:** DZ. Str. 65, 66 *Dihibridno križanje*	- Pokažejo naloge iz delovnega zvezka. -Sledijo razlagi na tabli in prepišejo diagram križanja. -Utrjujejo snov in zabeležijo navodila za domačo nalogo: DZ. Str. 65, 66 *Dihibridno križanje* Doma ponovijo in utrdijo znanje v spletni učilnici kjer rešijo test.

ZAKLJUČEK:

V razširjenem povzetku je predstavljena ena izmed mnogih učnih priprav pouka biologije na gimnaziji. Učitelj lahko s sistematično izdelanimi in urejenimi pripravami, vestno opravi svoje delo, načrtovano vodi dijake skozi izobraževalni proces, dijakom pa poleg dela v šoli, ponudi tudi možnost samostojnega domačega dela in preverjanja znanja v spletni učilnici. Tako ustvari manj stresno delovno okolje za samega dijaka in tudi za učitelja.

ABSTRACT

The presented research aimed to provide information about the most appropriate method for experimental work (teachers` demonstration experiment or students` experimental work in couples) in primary school chromatography topics from quality and durability of knowledge points of view. The results were collected with a pre- and two post- knowledge tests, working sheets accompanying experimental work and structured interviews with students, and processed both with qualitative and quantitative methods of data analysis. The results indicate, that students gain better and longer lasting knowledge by demonstration experiments, however they prefer conducting experiments by them-selves.

Keywords: *experiment, demonstration experiment, experimental work in couples, chemistry*

UVOD

V predstavljeni raziskavi smo preučevali, katera izmed izbranih oblik eksperimentalnega dela (demonstracijski eksperiment ali eksperimentalno delo učencev v paru) je v osnovni šoli bolj primerna za poučevanje in učenje izbrane učne vsebine iz vidikov: (1) učenčeve uspešnosti pri spremljanju poteka eksperimenta, (2) usvajanja novega znanja in (3) trajnosti usvojenega znanja. V raziskavi smo želeli izvedeti tudi, kakšne so prednosti in slabosti posameznih oblik eksperimentalnega dela skozi oči učencev.
Raziskave smo se lotili na podlagi pregleda pomena eksperimentalnega dela številnih raziskovalcev, ki preučujejo vlogo eksperimentiranja in izkustvenega pouka v okviru naravoslovja. Z vključevanjem te oblike dela naj bi tako: spodbujali radovednost in motivirali učence za naravoslovje, teoretično znanje preverili z ustreznimi eksperimenti, navajali na opazovanje, obdelavo, vrednotenje in prikaz rezultatov, olajšali razumevanje in učenje kemije, približati pojme in jih usvojili preko izkušnje, razvijali laboratorijske spretnosti, usvajanje eksperimentalnih tehnik in metod, pravilna uporaba šolske opreme, navajanje na upoštevanje navodil in varnostnih ukrepov, popestrili pouk (Johnstone in Al-Shuaili, 2001).

Nekateri avtorji opozarjajo, da velikokrat precenjujemo pomen eksperimentalnega dela in navajajo številne slabosti eksperimentalnega dela: učenci pri delu sledijo navodilom, ne da bi pri tem razmišljali o namenu eksperimenta, učenci ne iščejo povezav med eksperimentom in pojmi, ki so jih že usvojili pri pouku, zaradi nezadostnega predznanja učenci ne vedo, na kaj morajo biti pozorni pri eksperimentu in ne znajo razložiti opažanj, učenci ne vidijo zveze med načrtovanjem eksperimentalnega postopka in namenom raziskave, nekaterim učencem eksperimentalno delo predstavlja le odmor med običajnim, teoretično naravnanim poukom in ne kot intelektualni izziv za večino učencev so laboratorijske aktivnosti prezahtevne (Hodson, 1996).

V splošnem lahko povzamemo, da naj glede na učni cilj, ki ga želimo doseči, učitelji izbirajmo ustrezno obliko aktivnosti, ki je v danih okoliščinah najprimernejša.

METODA

Za namen raziskovalnega dela je bila razvita učna enota za vsebino kromatografije, za spremljanje napredka v znanju učencev predtest, potest in delovni list ter strukturirani intervju za poglobljeno preučevanje dojemanja eksperimentalnega dela skozi oči učencev (Logar, 2008). Zbrani rezultati so bili obdelani ob uporabi uveljavljenih kvantitativnih in kvalitativnih metod analize podatkov.

V raziskavi je sodelovalo 107 devetošolcev, ki smo jih glede na rezultate predtesta razdelili v dve enakovredni skupini, kontrolno in eksperimentalno skupino. Z eksperimentalno skupino smo izvedli učno uro z izvedbo eksperimentalnega dela v obliki učiteljeve demonstracije, s kontrolno skupino pa podobno učno uro z izvedbo eksperimentalnega dela v obliki eksperimentiranja učencev v parih.

REZULTATI

Uspešnost učencev smo preverjali s potestom (potest 1) takoj po učnem procesu in nato čez štirinajst dni ponovno z istim potestom (potest 2). Ugotovili smo, da so bili na *potestu 1* učenci eksperimentalne skupini uspešnejši od učencev kontrolne skupine ($t = 2{,}6$; $p<0{,}05$); najbrž zato, ker so bili skozi uro eksperimentiranja vodeni s strani učitelja demonstratorja, ki je usmerjal učence k opazovanju ključnih eksperimentalnih rezultatov in poudaril bistvene ugotovitve. Na *potestu 2* - pa je razlika med eksperimentalno skupino in učenci kontrolne skupine statistično nepomembna, ($t = 0{,}97$; $p>0{,}05$), torej sta obe skupini v trajno pridobljenem znanju izenačeni. Iz rezultatov sklepamo, da če učenci sami eksperimentirajo, znanje, ki ga osvojijo tisto uro ostane daljši čas na približno enakem nivoju, medtem ko učenci, ki spremljajo učiteljevo demonstracijsko izvedbo eksperimenta trenutno veliko znajo, vendar brez utrjevanja znanja del pridobljenega znanja hitro pozabijo.

Zanimala nas je tudi uspešnosti učencev pri sledenju izvedbe eksperimenta, kadar je le-ta izveden z eno izmed izbranih oblik eksperimentalnega dela. Analiza izpolnjenih delovnih listov učencev je pokazala, da je razlika v uspešnosti med skupinama statistično nepomembna ($t = 0{,}34$; $p>0{,}05$), torej sta bili obe skupini učencev enako uspešni.

V raziskavi smo s strukturiranim intervjujem skušali ugotoviti prednosti in slabosti preučevanih oblik eksperimentalnega dela skozi oči učencev. Ugotovili smo, da učenci raje delajo v parih, navajajo, da tako lažje razumejo snov, učijo se praktičnih veščin, bolje vidijo eksperiment, sodelujejo med seboj, delo si porazdelijo, so aktivni pri pouku in se ne dolgočasijo, kar se sklada z navedbami drugih raziskav.

ZAKLJUČEK

Povzamemo lahko, da vodi izvedba demonstracijskega eksperimenta (kratkoročno) do bolj kvalitetnega znanja, učenci pa raje eksperimentirajo sami, zato je v pouk smiselno vključevat oboje. Za ugotovitev ali je katera izmed primerjanih oblik dela primernejša za pridobivanje trajnega znanja pa bi bilo potrebno spremljati znanje učencev skozi daljše časovno obdobje v nadaljnjih raziskavah.

ABSTRACT

During our lessons we motivate students' project work through the problem-solving task so that they could develop their creativity through ideas and practical application. Through years of teaching we have observed that students are best involved if we give them a problem and stimulate them to search for solutions. The project is intertwined and overlapping with knowledge from different fields, usually already achieved from personal experiences of fourteen-year-old students. We guide them through all the steps of the development of their idea: from the sketching to critical evaluation and comparison of their final work with the others.

Keywords: *teaching techinc, differentation, problem aproach, improvement, creative thinking.*

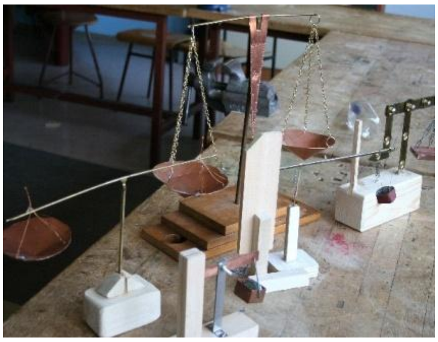
UVOD

Za uspešen razvoj sodobne družbe je potrebno že naše najmlajše navajati na iskanje novih, izvirnih idej, ki nas lahko v širokem, konkurenčnem okolju naredijo posebne in zanimive. Zato tudi pri šolskem delu spodbujava učence k inovativnosti. Na tak način pa razvijava občutek za prepoznavanje problemov družbe, ustvarjalnost in vizijo za izboljšave.

METODA

Pri načrtovanju daljšega projektnega dela je potrebno ugotoviti predznanje in izkušnje učencev osmih razredov ter upoštevati vse pogoje in časovne omejitve, ki jih določa učni načrt. Učence spodbudimo v iskanje čim bolj originale rešitve na zastavljen izziv: **Ali lahko star, zavržen dežnik postane uporabna tehtnica?**

V celotnem procesu učenci uporabljajo tudi znanja, ki so jih pridobili pri pouku fizike, matematike, naravoslovja. Pri tem izstopa transfer znanja, kot prenašanje učinka iz ene naučene dejavnosti na drugo. Pogosto se pri učencih izkaže želja po pridobivanju novega, uporabnega znanja v oblikah logičnega sklepanja, hipotetičnega razmišljanja, do pridobivanja ročnih spretnosti ob pravilni in varni uporabi orodij in naprav. Učence usmerjamo tudi v razvijanje lastne čustvene inteligence kot preskoka v razmišljanju in iznajdljivosti, prilagajanju in opazovanju osebnega napredka. Skozi takšno projektno delo lahko učenci dosežejo veliko operativnih ciljev: od iskanja izvirne ideje, preko delovnih obdelovalnih postopkov do preizkusov delovanje svojega izdelka. Pri spodbujanju ustvarjalnosti med mladimi lahko uporabimo različne metode poučevanja, ki jih izbiramo tudi glede na individualne potrebe učencev: metode razgovora, opisovanja, risanje in branje skice-načrta (metoda grafičnih del), metodo demonstracija, praktično delo (ročni in strojni postopki), metode sodelovalnega učenja – izmenjave izkušenj.



Slika1: Izdelki učencev-prevesne in vzvodne tehtnice

REZULTATI

Učenci so bili skozi celoten projekt, ki je trajal osem šolskih ur, visoko motivirani in uspešni, kar se je izkazalo v skupnem zaključnem razgovoru. Rezultati dela se kažejo izboljšanju medsebojnih odnosov med učenci - učiteljicami ter v inovativnih, končnih izdelkih, ki so se med seboj razlikovali v principu delovanja in izvedbah. Pri oblikovanju posodic za tehtnico so si učenci predhodno načrtovali in izdelali mrežo telesa. Pri proučevanju možnosti pritrjevanja posodic so samostojno preučevali najboljše pogoje za ravnovesje. Svoje ugotovitve so sproti beležili, pri tem pa iskali izvirne rešitve za izdelavo čimbolj unikatnega izdelka.

Ko so preverili delovanje naprave, so iskali možnosti izboljšav za doseganje še večje točnosti tehtnice. Učence sva sproti in pogosto opozarjali tudi na varno izvedbo vseh praktičnih postopkov in na uporabo zaščitnih sredstev. Učenci so tudi določili ceno izdelka in sodelovali pri določanju kriterijev vrednotenja izdelkov. Skozi celoten projekt je bilo čutiti pretok izmenjave izkušenj med vrstniki, prav tako pa so se učenci pogosto posvetovali tudi za nama. Nekateri končni izdelki so bili zelo inovativni in uporabni, tako da so učenci presegli naša pričakovanja.

ZAKLJUČEK

Ugotovili sva, da preučevanje zavrženih naprav in predmetov v mladih vzbuja razmišljanje o spremembi uporabe nekaterih delov, s tem pa razvijamo tudi čut za opazovanje in recikliranje. Poseben izziv vidiva tudi v tem, da se tudi medsebojno dopolnjujeva in prilagajava različnim potrebam učencev, tako da vsi dosežejo zastavljen cilj. Tako vodiva k inovativnosti učence, ki so bolj nadarjeni na tehniško ustvarjalnem področju in tudi ostale, ki pri iskanju rešitev potrebujejo pomoč.

Predstavljeni projekt je že preverjeni primer dobre prakse, kako lahko učencem s prepletanjem učnih vsebin dokažemo uporabnosti matematično naravoslovnih predmetov za iskanje praktičnih rešitev. Najini predlogi za učence prihodnjih generacij nakazujejo na drugačne izdelke insicer take, ki lahko nastanejo iz uničenega geometrijskega orodja, porabljenega kemičnega svinčnika, zavržene embalaže, elektromotorjev iz neuporabnih igrač, električnih zobnih ščetk,…ipd.

Takšen način šolskega dela, ki temelji na problemskem pristopu, pa mora biti s strani učitelja dobro planiran načrtovan in organiziran, tako da bo pouk za učence prijazen, zanimiv in primerno zahteven, predvsem pa varen in učinkovit, saj v njem vidiva priložnost za celostni razvoj otroka.

TEACHING TECHNICAL SUBJECTS WITH THE SUPPORT OF VIRTUAL CLASSROOMS
/
SPLETNE UČILNICE KOT DOPOLNILO PRI UČENJU STROKOVNIH PREDMETOV

Igor Petrovčič

Elektrotehniško-računalniška strokovna
šola in gimnazija Ljubljana

igor.petrovcic@gmail.com

ABSTRACT

This paper presents the usage of virtual classrooms as the effective support to the classical face-to-face teaching methods, with the focus on the technical subjects in the field of electrotechnics. Moodle enables e-materials to be used in the optimal way, provided that the teacher constantly keeps supervising the activities of his/her students. Additionally, due to the function of generating random data values, students always get individual assignments, which require and encourage individual work.

Keywords: *electrotechnics, e-materials, e-learning, Moodle*

UVOD

V času vse težje gospodarske situacije postaja znanje toliko bolj pomembno, zato je eden od osnovnih ciljev šole dijake čim bolje pripraviti za delo oziroma nadaljnji študij. Področje tehnike in naravoslovja zahteva *razumevanje* snovi, ne le učenje na pamet, kar pomeni kompleksnejši učni proces kot le učenje iz knjig. Dejstvo je, da se dijaki brez učiteljeve razlage, laboratorijskih vaj in obilo lastnega dela stroke ne morejo naučiti. Obenem je za precej dijakov značilno, da k učenju pristopajo kampanjsko in po najmanjši liniji odpora.

NEIZKORIŠČENI POTENCIAL E-GRADIV

Razvoj interaktivnih gradiv je vsekakor pripomogel k večji razgibanosti pouka, vendar to še ni dovolj za boljše znanje dijakov. V praksi se je namreč izkazalo, da so dijaki sicer navdušeni nad številnimi e-gradivi, s katerimi so se seznanili med urami strokovnih predmetov, vendar tovrstni materiali zahtevajo določeno mero samodiscipline. Brez mehanizma, ki tudi spremlja dejavnosti dijakov, še tako dobra e-gradiva ne morejo biti optimalno izkoriščena.

Poskus rešitve tega problema je uvedba spletnih učilnic, ki bi služile kot dopolnilo pri poučevanju strokovnih predmetov na Elektrotehniško-računalniški strokovni šoli in gimnaziji Ljubljana. Dijaki naše šole so imeli že vrsto let pred tem na razpolago e-gradiva, ki sem jih pripenjal na šolsko internetno stran, da bi jim olajšal učenje, vendar nisem imel vpogleda, v kolikšni meri se jih dijaki res poslužujejo.

METODA

Da bi ugotovil, ali je mogoče učni uspeh s kontrolirano rabo interaktivnih gradiv izboljšati, sem uporabil komparativno metodo. Na začetku šolskega leta sem pouk strokovnih predmetov izvajal le na klasični način, v učilnici, pri čemer sem dijakom predstavil tudi obstoječa e-gradiva, jih spodbujal, naj snov predelajo, jih večkrat napotil na uporabo e-gradiv in »zaupal« njihovi besedi, da so vaje resnično opravili. Po predelanem tematskem sklopu je sledilo preverjanje znanja. Zatem sem e-gradiva preselil v spletne učilnice, pri čemer sem dijake seznanil s tem, da imam vpogled v njihove dejavnosti.

Vaje so bile istega tipa kot pri klasičnem pouku, razlika je bila le v eni pomembni podrobnosti. Pri vsakem reševanju naloge so se podatki naključno spreminjali, tako da dijaki nalog niso mogli enostavno prepisati od sošolcev. Vaje smo sprva skupaj reševali pri urah, da so se dijaki spoznali z novostjo, potem pa so jih reševali samostojno za domače naloge. Po predelanem tematskem sklopu je sledilo ponovno preverjanje znanja. Rezultati testov bodo prikazani v nadaljevanju, v tabeli 1.

SPLETNE UČILNICE V MOODLU

Iz zgoraj omenjenih vzrokov, kot tudi iz potrebe po boljšem pregledu osvojene snovi in težav, ki se pri učenju pojavljajo, sem začel uporabljati spletne učilnice v okolju Moodle. To okolje je idealna rešitev za dosego zadanih ciljev, saj poleg številnih možnosti omogoča tudi sledenje dejavnosti.

Dejavnosti v okviru Moodla so izjemno uporabne pri laboratorijskih vajah, saj omogočajo, da dijaki isto vajo rešujejo timsko, a obenem povsem individualno, kar bo prikazano tudi na primeru ene od letošnjih spletnih učilnic. Naloge so namreč izdelane tako, da dosežemo naključno spreminjanje vrednosti podatkov. Individualno delo je zagotovljeno tudi za domače naloge, saj jih dijaki ne morejo prepisovati, hkrati pa odpade »pregledovanje zvezkov« med urami, kar sicer vzame precej časa, ki ga lahko bolje izkoristimo za obdelavo snovi.

REZULTATI

Z uvedbo spletnih učilnic in stalnega nadzora nad dejavnostmi posameznikov se je znatno izboljšal tudi učni uspeh pri strokovnih predmetih. Tabela 1 prikazuje skupne rezultate treh razredov drugega letnika

Tabela 1: Učni uspeh pri nekontrolirani in kontrolirani rabi e-gradiv

doseženi rezultati (NMS-5)	ocene testa pred uvedbo spletne učilnice (vzorec: 80 dijakov)	ocene testa po uvedbi spletne učilnice (vzorec: 83 dijakov)
odlično (5)	6	19
prav dobro (4)	4	10
dobro (3)	6	14

zadostno (2)	14	12
NMS	50	28
povprečna ocena	1,775	2,759

ZAKLJUČEK

Moodle se je izkazal kot dobra motivacija za dijake, saj udeleženci vedo, da je učitelj seznanjen z njihovim delom. Po drugi strani so dobljeni podatki izredno koristni tudi za učitelje, saj predstavljajo zanesljive povratne informacije o težavnejših mestih pri razumevanju stroke.

TEHNICAL CREATIVITY IN THE FORM OF PROJECT WORK WITHIN THE CURRICULUM OF THE TECHNICAL DAY FROM 1 st TO 9 th GRADE
/
TEHNIČNA USTVARJALNOST V OBLIK PROJEKTNEGA UČNEGA DELA V OKVIRU TEHNIŠKEGA DNE OD 1. DO 9. RAZREDA

Ivan Pišek

OŠ Griže

Ivan.Pisek@guest.arnes.si

ABSTRACT

Technical days often take the form of a learning project work. This way of learning is one of those forms which are based on experiential learning and which encourage students to funcition actively in all stages of work (planning tasks, collecting data, designing statements, presentations). Technical days enable to develop team cooperation within the school expert working groups.

The ultimate goal of technical day which is described in the contribution was to make an useful product

on the christmas holidays theme in all classes. Class teachers and students made an agreement about the basic material for the work. Students prepared an exhibition of finished products with the help of the class teachers. Parents were also able to see them at the parental meeting.

Keywords: *educational project work, team cooperation, technical days, tehnical creativity*

UVOD

Dnevi dejavnosti so tisti del obveznega programa osnovne šole, ki medpredmetno povezujejo discipline in predmetna področja, vključena v predmetnik osnovne šole. Cilji dni dejavnosti so omogočiti učenkam in učencem utrjevanje in povezovanje znanj, pridobljenih pri posameznih predmetih in predmetnih področjih, uporabljanje teh znanj in njihovo nadgrajevanje s praktičnim učenjem v kontekstu medsebojnega sodelovanja in odzivanja na aktualne dogodke v ožjem in širšem družbenem okolju. Tehniški dnevi se povezujejo s cilji tehnike in tehnologije ter gospodinjstva. V tem šolskem letu smo se prvič lotili izvedbe tehniškega dne od 1. do 9. razreda. Vidno je bilo veliko sodelovanja tako med učitelji kot učenci.

METODA

Težišče načrtovanja je bilo izvedeno v okviru strokovnih aktivov in se je izvajalo kot timsko delo vseh učiteljev na šoli. Temeljni cilj tehniškega dne je bil izdelati uporaben izdelek na temo božično-novoletnih praznikov, ki ga lahko otroci nesejo domov. Učitelji razredniki so dogovorili skupaj z učenci uporabo osnovnega materiala za delo. Učenci so tako ta dan ustvarjali iz papirja, gline, moosgumija, stekla, tekstila. Vsem tem materialom pa so dodali še mnoga druga (tudi naravni material, ki so ga uporabili učenci 9. razreda, da so izdelali namizno dekoracijo). Dogovorjeni cilji, ki smo jim v teh dneh sledili, so bili:

- spoznati decembrske praznike,

- predstaviti običaje ob praznikih v mesecu decembru,

- raziskati zgodovino posameznih praznikov,

- izdelati voščilnice iz različnih materialov v različnih tehnikah,

- izdelati okraske iz različnih materialov za okrasitev doma in šole,

- dokumentirati dogajanje,

- ovrednotiti opravljeno delo in pripraviti razstavo.

Najprej so učenci dobili osnovna navodila za delo, uporabo materialov in pripomočkov. Prevladovale so medote demonstracije, razlage, praktičnega dela. Učitelji razredniki in nerazredniki smo učencem utemeljili pomen natančnosti izdelave in estetskega izgleda izdelka. Posebno pozornost smo učitelji izvajalci namenili skrbi za varnost (pravilni uporabi orodij: škarij, klešč … in pravilni uporabi naprav na električni tok: pečica, lepilna pištola …).

REZULTATI

V prvem razredu so učenci uporabili pri izdelovanju izdelkov stiropor, krep papir, dass maso in dekorativni material. Izdelali so venčke, voščilnice in figurice za novoletno jelko. Učenci drugega razreda so uporabili glino. Izdelali so svečnike in prašičke za srečo. V tretjem razredu so se odločili izdelati uporaben izdelek iz moosgumija (tablo za urnik in pomembne datume), da bodo odslej redno v šolo nosili vse potrebno. Četrti razred je iz gline izdeloval posode in ptičke. Učenci obeh petih razredov so pri delu uporabili papir. Izdelali so zvezde, voščilnice in svečnike. V šestem razredu so oblikovali papir v voščilnice. Iz dass mase so naredili posode za bonbone. Nekateri pa so naredili sliko s pomočjo sukanca. Za učence sedmih razredov je bil tehniški dan organiziran zunaj šole (v steklarski delavnici). Naučili so se poslikave na steklo z barvami. Izdelali so okvirje za slike in hišne številke s postopkom fuzije. Izdelali so tudi ogledala s pomočjo peskanja. V osmem razredu so dali poudarek izdelovanju iz tekstila. Vsak učenec je izdelal božično nogavico in snežaka, ki je imel osnovo iz stiropornih kroglic. Deveti razred je s pomočjo naravnega in dekorativnega materiala izdeloval adventne venčke. Ustvarjali so ob pomoči učiteljice in učenk iz srednje vrtnarske šole Celje.

Spodnje slike prikazujejo izdelke, ki smo jih razstavili na skupnem roditeljskem sestanku 3.12. 2009, v telovadnici šole.

nadja.malovrh@zrss.si

ABSTRACT

With the updating of grammar-school programs and chemistry teaching we lay stress on competence oriented education. In this way we stimulate student activity and their participation in creation of chemistry lessons. The updated curriculum plans of chemistry teaching in grammar-school stimulate and make possible teacher's autonomy. Teachers can search and develop their own way of learning/teaching goals achievement (student's activities, arrangement of learning complex, content…).

School-subject development group for chemistry in grammar-school together with teachers – mentors develop professional groundwork tested in practice. The results are used within regular professional staff training – for chemistry teachers and their laboratory assistents in grammar-schools.

***Keywords**: chemistry, updating of grammar-school programs, curriculum plan, introduction, education*

UVOD

Živimo v skupnosti, kjer je edina stalnica dejstvo, da se vse spreminja. Spreminjajo se vzorci zaposlovanja, preživljanje prostega časa, vrednote, spreminjajo se temeljna znanja in veščine, potrebna za uspešno delo in življenje. Tem spremembam sledijo tudi koncepti in načini pridobivanja znanj in veščin, ki razvijajo inovativnost, ustvarjalnost in fleksibilnost pri povezovanju znanj različnih predmetnih področij. V ospredju so vrednote, ki razvijajo osebno odgovornost, veščine in strategije učenja (spoznavanje) ter prepoznavanje konceptov, ki so skupni različnim področjem dela. Vse to pa zahteva spremembe v vseh dokumentih, ki se navezujejo na izobraževanje, še posebej v učnih načrtih. Za kemijo kot splošno-izobraževalni predmet v gimnazijah, že dolgo ne velja več, da je obvladovanje temeljnih konceptov znanja in usvajanje osnovnih veščin laboratorijskega dela dovolj, da bi dijaki predmet lahko povezovali z drugimi predmetnimi področji oz. pridobljena znanja tudi funkcionalno uporabljali. Poučevanje in učenje kemije zato mora spreminjati iz vsebinskega in didaktičnega vidika. Znanje ni več opredeljeno le z rezultati (katere učne vsebine so usvojene in koliko), ampak tudi s procesi učenja: kako dijaki izbrane pojme razumejo, utemeljujejo, uporabljajo, analizirajo, vrednotijo, povezujejo, kritično presojajo; kako se znajdejo med različnimi viri in kako se izražajo. Razvijanje veščin kompleksnega mišljenja in spretnosti, ki so procesno naravnane ter povezane z vrednotami in miselnimi navadami posameznika, so tudi osnova za razumevanje trajnostnega razvoja. Gre za premik od objektivističnega h konstruktivističnemu učenju. Vse omenjene spremembe v izobraževanju zahtevajo tudi sistematično usposabljanje učiteljev na vseh ravneh izobraževanja.

Predmetna razvojna skupina za kemijo v gimnazijah skupaj z učitelji mentorji razvija strokovne podlage za uvajanje sprememb v pouk kemije, jih preizkuša v praksi in jih vokviru rednih izobraževanj ter partnerskega sodelovanja posreduje učiteljem in laborantom kemije v gimnazijah.

METODA

Posodabljanje pouka kemije v gimnazijskih programih se je sistematično pričelo že leta 2003 s projektoma Didaktična prenova in Evropski oddelki Zavoda RS za šolstvo. V okviru obeh projektov smo skupaj z učitelji kemije, ki so bili vključeni v projekt, analizirali obstoječe učne načrte za kemijo v gimnazijah (1998) in razvijali nove pristope ter učne situacije, ki v čim večji meri zagotavljajo učinkovito učenje kemije, kakovostno znanje in razvijanje samostojnega in ustvarjalnega mišljenja pri dijakih. Posodabljanje se je nadaljevalo z ustanovitvijo Predmetne komisije za posodabljanje učnih načrtov (2006), sestavljena je bila iz univerzitetnih učiteljev kadrovskih fakultet, učiteljev praktikov in svetovalcev Zavoda RS za šolstvo. Komisija je na osnovi pridobljenih rezultatov in spoznanj obeh projektov, spremljave pouka kemije v gimnazijah (ZRSŠ), analize tujih UN, mednarodnih raziskav in sodobnih trendov didaktike kemije, pripravila predlog posodobljenih UN za kemijo v gimnazijskih programih. Februarja 2008 je Strokovni svet RS za splošno izobraževanje sprejel posodobljena učna načrta za kemijo v gimnazijskih programih.

Sistematično uvajanje obeh učnih načrtov se je pričelo s prvimi letniki v šolskem letu 2008/09, v okviru projekta Ministrstva za šolstvo in šport, Evropskih strukturnih skladov in Zavoda RS za šolstvo, z imenom Posodobitev gimnazijskih programov, Predmetna komisija za posodobitev učnih načrtov je pridobila nove člane in se preoblikovala v Predmetno razvojno skupino za kemijo v gimnazijah (v nadaljevanju PRS za kemijo v gimnazijah). K sodelovanju je povabila 15 učiteljev mentorjev.

REZULTATI

V posodobljenem učnem načrtu je v ospredju uresničevanje razvijanja naravoslovno-matematične kompetence za razvoj kompleksnega in kritičnega mišljenja. Nekoliko je tudi spremenjen vrstni red posameznih vsebin, izpuščene so nekatere vsebine, ki so za srednješolsko raven prezahtevne ali jih obravnavajo pri drugih naravoslovnih predmetih. Dodane so nekatere vsebine, ki naj bi popestrile pouk kemije v smislu večjega povezovanja z življenjem. Posodobljen učni načrt zahteva tudi sistematično vpeljevanje submikroskopskih prikazov, to je zelo pomembno za lažjo razlago in napovedovanje pojavnega sveta snovi, pojavov in procesov na makroskopski ravni. Pri učenju kemije je pomembno, da učenci oz. dijaki razumejo in znajo povezovati pojme na vseh treh predstavnih ravneh (makroskopski, sub-mikroskopski in simbolni), kar predstavlja za mnoge učence in dijake veliko težavo. Poleg vsebinskih posodobitev posodobljeni učni načrt za kemijo zahteva izvajanje določenih učnih sklopov v obliki sodelovalno-projektnega oziroma eksperimentalno-raziskovalnega dela, ki temeljita na aktivnostih dijakov, učitelj pa pri tem postane usmerjevalec in organizator pouka in učenja.

Pri uvajanju novosti v pouk kemije, namenjamo veliko pozornost razvoju primerov dobre prakse, ki vključujejo zgoraj omenjene novosti iz učnega načrta. Učitelji mentorji v sodelovanju s člani PRS za kemijo v gimnazijah so v preteklem letu intenzivno uvajali te novosti v svoj pouk. Svoje izkušnje in spoznanja prenašajo na ostale učitelje v okviru rednih izobraževanj. Izšla bo tudi publikacija Posodobitve pouka kemije v gimnazijski praksi, ki bo učiteljem kemije v gimnazijah v pomoč pri iskanju njihovih lastnih poti udejanja ciljev posodobljenega učnega načrta za kemijo.

ZAKLJUČEK

V izobraževanju se morajo spremembe uvajati postopoma. Novi dokumenti in morebitne reforme niso dovolj. Resnična sprememba se zgodi šele z drugačnim razmišljanjem učiteljev, ki so pripravljeni sprejeti vlogo učitelja organizatorja in svetovalca namesto vloge prenašalca znanj. Ta pot pa zahteva intenzivno partnersko in procesno delo z učitelji, da bodo zmožni razumeti družbene spremembe, ki zahtevajo drugačen pouk, le tako bodo zmožni izobraževati in usmerjati dijake v uspešno življenje. Prvi koraki so narejeni, z učitelji kemije skupaj načrtujemo, iščemo rešitve, opazujemo, evalviramo in se na izkustven način učimo. Zgodba strokovnega in osebnega spreminjanja učiteljev kemije je izziv in odgovorna naloga PRS za kemijo v gimnazijah.

POPULARISATION AND INCREASING OF INTEREST IN PHYSICS IN PAST YEARS AT CELJE FIRST GRAMMAR SCHOOL
/
POPULARIZACIJA IN POVEČANJE ZANIMANJA ZA FIZIKO V ZADNJIH LETIH NA I. GIMNAZIJI V CELJU

Nataša Ravnikar

I. gimnazija v Celju

natasa.ravnikar@guest.arnes.si

ABSTRACT

In this contribution, some activities performed in the field of physics at our school in recent years are presented. We are establishing that the above mentioned activities have contributed a lot to increasing of interest in this natural science area. One of the indicators of the increasing of interest and participating in physics is raising the number of candidates at physics as an optional subject at matura.

Keywords: *physics, activities, popularisation, increasing of interest*

UVOD

Na I. gimnaziji v Celju poleg rednega pouka fizike v zadnjih letih izvajamo nekatere dejavnosti, ki so prispevale k povečanju popularnosti fizike ter naravoslovja nasploh. Opažamo porast števila maturantov, ki se odločajo za izbiro fizike, več dijakov se udeležuje tekmovanj iz znanja fizike. Obenem na vseh področjih dosegajo tudi dobre rezultate. Povprečna ocena na maturi je okoli 4,0, v zadnjih letih sta dva dijaka naše šole rešila naloge na državnem tekmovanju iz fizike v celoti pravilno. V prispevku bodo predstavljene dejavnosti, s katerimi na šoli povečujemo interes na področju fizike.

METODA

Organizirali in izvedli smo strokovne ekskurzije v Ljubljano 2005 ob svetovnem letu fizike (na IJS, kjer nam je predaval tudi prof. dr. Janez Strnad, v HE), leta 2006 smo na Dunaju obiskali Tehniški muzej, 2007 v Muenchnu tehniški in letalski muzej ter rudnik soli pri Salzburgu in aprila 2009 v Švici raziskovali Znanstveni center v Winterthuru, popotovali po krajih, kjer je živel in delal Albert Einstein (Zurich, Bern) ter si v Cernu, Ženeva, ogledali "Anti-matter factory" ter kalorimeter Atlas. (Slika 1)

Slika 1: Fizikalna ekskurzija v Švico, Ženeva, Cern 3. 4. 2009

Fiziki aktivno sodelujemo pri aktivnostih Naravoslovnega društva I. gimnazije v Celju (http://naravoslovci.org/). Bili smo pionirji na tem področju in še pred ustanovitvijo organizirali zanimiva predavanja, med drugim predavanje dr. Marka Pleška o pospeševalnikih. Vsa leta izvajamo fizikalni in astronomski krožek z vsaj nekaj opazovanji letno. Pomladi 2008 smo sodelovali tudi pri pripravi verižnega eksperimenta v Tehniškem muzeju Slovenije. Vseskozi posodabljamo opremo, ki jo uporabljamo pri frontalnem pouku, kot tudi pri laboratorijskih vajah. Poleg redne uporabe interaktivne table in kamere na katedru, pogosto uporabljamo senzorje in vmesnike Vernier, trenutno 8 kompletov.

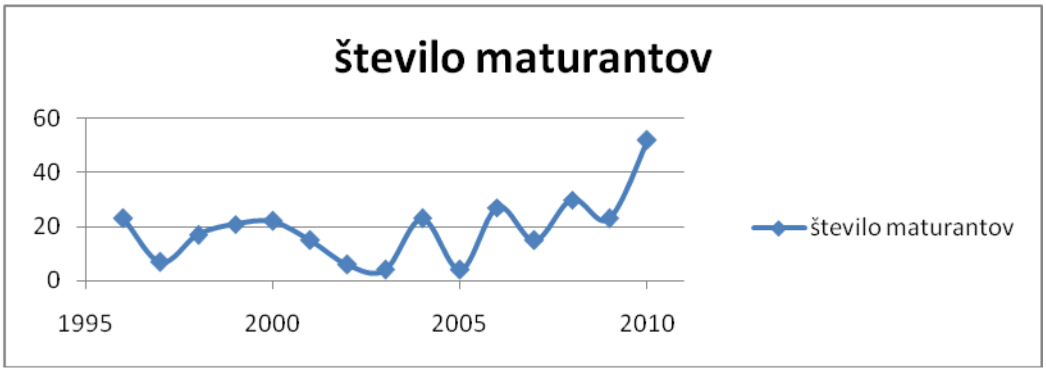
Hkrati v vsakdanje delo uvajamo moderne metode poučevanja kot so sodelovalno poučevanje profesorja in laboranta, timsko se povezujemo z drugimi predmetnimi področji (matematika, športna vzgoja, geografija), dijakom omogočamo vsakodnevno avtentično učenje, sodelovalno učenje, delo na terenu (določanje pretoka reke Savinje, povprečne hitrosti hoje, tekmovanje v vodoravnem metu ipd.). Učitelji fizike in laborant se redno izobražujemo tako v Sloveniji kot tujini. Izreden pomen vidimo v primernem odnosu do dijakov in njihovega dela. Pri vseh dejavnostih delujemo timsko in pomagamo drug drugemu pri organizaciji. Velik poudarek dajemo na sproščeno ozračje pri laboratorijskem delu.

REZULTATI

V zadnjih letih se je povečalo število dijakov, ki šolo zastopajo na regijskem tekmovanju iz znanja fizike. Točni podatki niso dosegljivi. Na državno tekmovanje se uvršča več dijakov kot v prejšnjem desetletju. Postopoma se je povečalo število dijakov, ki izberejo fiziko na maturi kot enega od izbirnih predmetov (Tabela 1, Grafikon 1).

Tabela 3: Število prijavljenih kandidatov na maturi iz fizike (vir: letna poročila in LDN šole)

Leto	**1996**	**1997**	**1998**	**1999**	**2000**	**2001**	**2002**	**2003**	**2004**	**2005**	**2006**	**2007**	**2008**	**2009**	**2010**
Število kandidatov	23	7	17	21	22	15	6	4	23	4	27	15	30	23	52



Grafikon 1: Število kandidatov na maturi iz fizike od leta 1996 do 2010

ZAKLJUČEK

V prihodnjih letih načrtujemo nadaljevati s temi dejavnostmi oziroma jih sproti dodajati. Pomembno je, da ohranimo in še zvišamo nivo znanja, ki ga dosežejo dijaki v gimnaziji. Veseli nas, da dijaki radi pridejo k uram fizike, da so sproščeni ob hkratnem pridobivanju konkretnih znanj, tako kot pri razvijanju naravoslovnih kot tudi splošnih kompetenc. Pomembno je, da v teh letih pridobijo izkušnje, ki jih bodo lahko koristno uporabili kasneje.

REFERENCE

Letna poročila od 1996 do 2009, Celje, izdaja I. gimnazija v Celju (zanjo mag. Anton Šepetavc).

ENCOURAGING Technical CREATIVITY in the first class
/
Spodbujanje tehnične ustvarjalnosti v prvem razredu

Darja Rijavec

OŠ Ivana Roba Šempeter pri Gorici

darja.rijavec@gmail.com

ABSTRACT

The aim of this paper is to show how the author encouraged first-class pupils to develop technical creativity and cooperative learning. An example of project learning work is presented. Pupils made various decorative /ornamental and useful products from various natural and synthetic materials, using different tools and devices. Simultaneously with the course of the project, a research was carried out whose aim was to determine whether students have mastered the objectives of technical creativity/manual skills, provided by the first-class curriculum and whether they will improve graphomotorics.

Keywords: *project learning work, technical creativity, after school activities, the products.*

UVOD

Nadarjenost je potencial, lastnost, ki jo človek prejme ob rojstvu. Otrokova nadarjenost pa se redko sama po sebi izkazuje in razvija. Otroku je potrebno nuditi tako okolje, v katerem bo našel dovolj varnosti, spodbud in motivacije za njeno izkazovanje in razvijanje. Otrok lahko izraža svojo nadarjenost le preko dejavnosti, pri katerih je ustvarjalen. Nadarjenost ni nekaj dokončnega. Otrok, ki ima veliko priložnosti udeležbe v ustvarjalnih dejavnostih, bo svojo nadarjenost lahko neprestano razvijal. Strokovnjaki pravijo, da je idealno obdobje za odkrivanje in razvoj nadarjenosti, prav zgodnje otroštvo. Učitelj običajno prej opazi učence, ki so splošno nadarjeni, kot tiste, ki imajo nadarjenost povezano s praktičnimi sposobnostmi. Slednji pritegnejo pozornost le pri dejavnostih, ki so povezana z tehnično ustvarjalnostjo. V sodobnem gospodarstvu je za tehnični napredek ključnega pomena, dobro timsko sodelovanje. Če želimo učence usposobiti za potrebe sodobnega gospodarstva, jim moramo nuditi možnost sodelovanja pri dejavnostih, ki spodbujajo tehnično ustvarjalnost in sodelovalno učenje. Izbrati ustrezne dejavnosti s katerimi bo zadovoljil interes učencev in jih pritegnil k aktivnemu sodelovanju, je za učitelja zelo zahtevna naloga.

V nadaljevanju je prikazan primer projektnega učnega dela, katerega namen je bil spodbujanje tehnične ustvarjalnosti in sodelovalnega učenja pri prvošolcih.

METODA

Projektno učno delo je bilo izvedeno v času podaljšanega bivanja z učenci prvega razreda osnovne šole Ivana Roba Šempeter pri Gorici. Potekalo je dva meseca: od jesenskih do božično-novoletnih počitnic. Glede na čas izvajanja je bilo vsebinsko povezano s prazniki, ki se zvrstijo v prednovoletnem času. Namen projekta je bil razvijati izkustveno učenje, vzpodbujanje medsebojnega sodelovanja in razvijanje ter spodbujanje ustvarjalnih potencialov učencev na področju tehnike. Vzporedno z izdelovanjem izdelkov so učenci spoznavali jesenske in zimske praznike, ter povezanost izdelkov, ki so jih izdelali, s kulturno, versko in državno tradicijo.

Učenci so si ogledali nekaj različnih izdelkov vezanih na čas jesensko-zimskega obdobja. Njihova dovršena izdelava in ustvarjalne poslikave, so učence zelo očarale. Učiteljica jim je predlagala, da bi izvedli projekt, v katerem bi vsak učenec izdelal svoje izdelke. Nad predlogom so se učenci navdušili.

Skupaj z učiteljico so načrtovali skico projektnega dela. Med izdelovanjem skice so se učenci pogovarjali, izmenjevali ideje in mnenja ter dajali predloge za potek projekta. Učenci prvega razreda še ne znajo pisati, zato je skico napisala učiteljica na večji plakat, učenci pa so skico dopolnili z risbami, da bi si lažje zapomnili načrt dela. S skupno izdelanim načrtom, so si pomagali pri nadaljnjem izvajanju projekta.

Načrt je predvideval izdelavo treh med seboj tematsko različnih izdelkov: darila, voščilnice in obeske za božično drevo.

Učenci so se na začetku projekta razporedili v skupine, ki so ostale nespremenjene ves čas trajanja projekta. Vsaka skupina je enkrat tedensko dobila dve nalogi. Najprej je morala skupno izdelati določen izdelek: darilo, voščilnico ali obesek, nato pa so si tekom tedna izdelek izdelali vsi člani skupine. Delavnice so bile organizirane tako, da je vsaka skupina dobila zadostne količine najrazličnejših naravnih in umetnih gradiv in orodij za obdelavo ter načrt tehnologije izdelave izdelka po fazah. Vsak načrt za izdelek je bil razdeljen na stopnje s kratkim in jedrnatim navodilom za delo. Vsaki stopnji je bila dodana tudi fotografija, s katero so si učenci pomagali pri delu in tako potrebovali manj pomoči učitelja in so pri delu bili tako bolj samostojni. Branje načrtov, je eden pomembnih dejavnikov tehnične pismenosti. Pomembno pa je, da je načrt prilagojen starostni stopnji učencev.

Za izvedene delavnice je bila značilna barvitost in razigranost. Učenci so se nemoteno gibali po učilnici, si medsebojno pomagali in svetovali. Učiteljica ni skušala mladih ustvarjalcev vkalupljati v nek vnaprej zamišljen izdelek, ampak jih je spodbujala k lastni ustvarjalnosti. Učence je spodbujala k uresničitvi njihovih idej in jim, predvsem manj ustvarjalnim in spretnim, pomagala tudi njihove zamisli uresničevati.

Ob izdelovanju izdelkov, so učenci spoznavali lastnosti gradiv in pridobili izkušnje obdelave papirja, tanjšega kartona, Das mase, slanega testa, čebeljega voska, stekla, različnih semen in različnih vrst zdroba. Pri delu so uporabljali različno orodje in pripomočke: svinčnik, škarje, olfa nož, šablone, valj, modelčke za pecivo, lepilno pištolo ter tako pridobivali spretnost za rokovanje z njimi.

Sočasno s potekom projekta je bila izvedena tudi raziskava, katere namen je bil ugotoviti ali bodo učenci usvojili cilje s področja tehnike, ki jih predpisuje učni načrt prvega razreda in ali se jim bo izboljšala grafomotorika.

REZULTATI

V okviru projekta so bili v obdobju dveh mesecev, izdelani številni uporabni, simbolni in okrasni izdelki vezani na ta čas. Skupno je bilo izdelanih okrog sto izdelkov. Učenci so ob njihovem izdelovanju spontano spoznavali jesenske in zimske praznike, ter povezanost izdelkov s kulturno, versko in državno tradicijo. Med potekom projekta so učenci razvijali veselje do tehnično ustvarjalnega dela. Uporabljali in spoznavali so njim primerne materiale in orodja. Med praktičnim delom so krepili pozitivne osebnostne lastnosti: pripravljenost za sodelovanje, nudenje in sprejemanje pomoči, samopodobo, domišljijo, samokritičnost, delovne navade in čut za estetiko. Ob uporabi različnih gradiv, so spoznali njihove lastnosti. Rokovanje z različnimi orodji je pripomoglo k razvoju finomotorike rok in prstov.

Delavnice, ki so bile izvedene v okviru projekta, predstavljajo dober primer vzajemnega prenašanja znanja med učenci. Sodelovalno učenje v okviru delavnic se je izkazalo kot zelo dobra metoda za obravnavo žive teme – praznovanja, ki povezuje že sama po sebi. Tema se je izkazala kot otrokom zanimiva. Smotrnost učenja je bila zagotovljena, saj so bile izbrane vsebine in dejavnosti blizu otrokovim interesom. Zanje so bile pomembne, ker so jim pomagale pri razumevanju sveta, pojavov in odnosov v njem.

ZAKLJUČEK

Avtorica ugotavlja, da je projektno učno delo zelo primeren didaktičen sistem za delo v prvem razredu. Učenci so ob zaključku projekta bistveno bolje poznali lastnosti gradiv, orodij in pripomočkov za njihovo obdelavo. S svojimi besedami so znali opisati tehnološke korake pri izdelavi posameznih izdelkov. Postali so bolj spretni pri rokovanju z orodji in pri nekaterih tehnoloških postopkih: rezanju, valjanju, gubanju, prepogibanju, spenjanju, lepljenju... Pridobljene spretnosti so pripomogle k izboljšavi učenčeve grafomotorike in samozavesti ter posredno splošne uspešnosti. Izkušnja potrjuje, da bi bilo potrebno, tovrstno učenje in sodelovanje pogosteje umestiti v vzgojno-izobraževalni proces.

Camilla Schreiner

University of Oslo, Norway

camilla.schreiner@ils.uio.no

ABSTRACT

ROSE is an international comparative study that investigates the diversity of interests, experiences, priorities, hopes and attitudes that children in different countries bring to school or have developed at school. The underlying hope is to stimulate an informed discussion on how to make science education more relevant and meaningful to students in ways that respect gender differences and cultural diversity. We also hope to shed light on how to stimulate interest in S&T-related studies and careers. ROSE has developed, after consultation with science educators from all continents, an instrument that tries to examine the attitudes of 15-year-old students. The ROSE instrument has around 250 single items – simply worded questions or statements requiring responses on a 4-point Likert scale. This enables the use of standard statistical methods like calculations of means and correlations. About 40000 students from 35 countries took part in ROSE, and about 10 PhD students from different countries will base their theses on ROSE data. Schreiner & Sjřberg (2004) report fully on the project rationale, development and logistics. Additional information, including reports on data collection from the participating countries, is available on the ROSE website. Several comparative articles and international reports have been published and more are planned.

UVOD

V mnogih visoko razvitih državah je opaziti občuten odklon v odločanju učencev za naravoslovje in tehniko (N&T). 'Evropa potrebuje več naravoslovcev' je naslov poročila Gibanja za povečanje humanističnih virov v naravoslovju in tehniki v Evropi (EC,2004). Poročilo obravnava stanje N&T v Evropski Uniji in posveča posebno pozornost številu ljudi, ki se odločajo za študij in zaposlitev na področju N&T. Naslov poročila razkriva bistvo: upad zanimanja za študij N&T je velik problem v večini držav Evropske Unije. Podobno težavo opažajo tudi v ZDA in večini drugih držav OECD.

Paradoks je, da večina evropskih gospodarstev, ki temelji na N&T, opaža pomanjkanje zanimanja za študij in zaposlovanje na področju N&T. Vse države pa se strinjajo glede pomembnosti visoko izobraženih in usposobljenih znanstvenikov. Ampak mladi ne izbirajo študija, ker bi to pripomoglo k domačemu gospodarstvu, njihova odločitev temelji na njihovih interesih, vrednotah in prioritetah. Očitno je, da odločanje za študij N&T ni več tako privlačno v bogatejših državah kot je to bilo pred desetletji.

Pomanjkanje interesa za N&T v šolah ni samo problem za gospodarstvo, ampak tudi grožnja za demokracijo, kajti večina odločitev v modernih družbah je odvisna od premislekov, ki vključujejo odločanje med znanstvenimi argumenti in vrednostnim sistemom. Naravoslovno nepismena množica ljudi lahko zlahka podleže propagandi v primeru volitev.

Zaradi naštetih razlogov je ključnega pomena razumeti težnjo N&T, prioritete in interese mladih: to so cilji projekta ROSE.

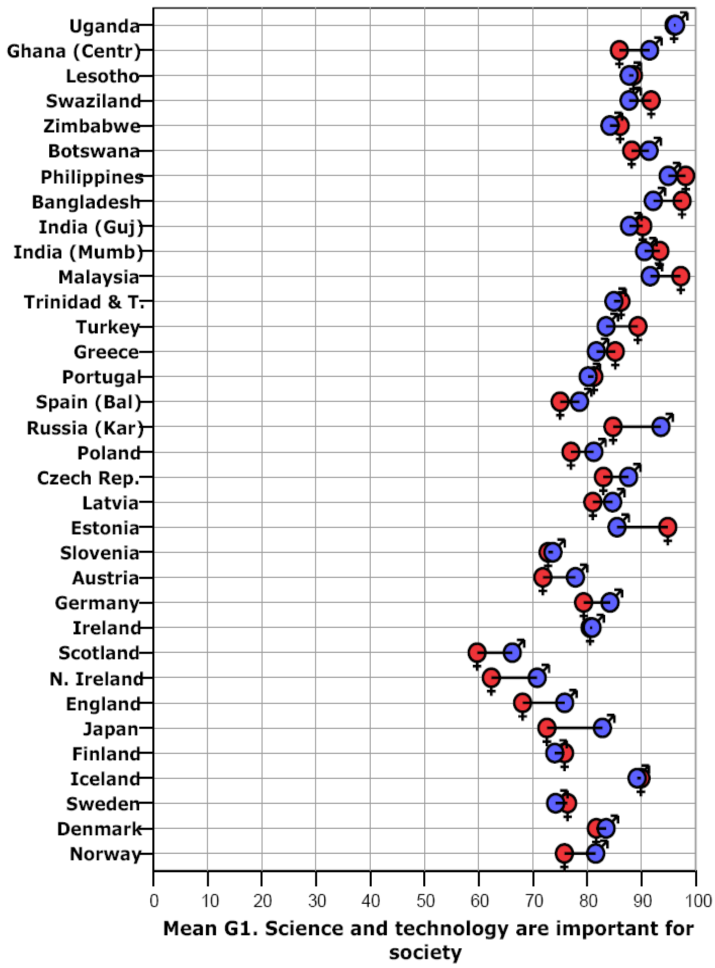
POZITIVNO DOJEMANJE NARAVOSLOVJA IN TEHNIKE V DRUŽBI

Kadar opazimo pomanjkanje zanimanja za študij in zaposlovanje na področju N&T v posamezni državi, najprej pomislimo, da imajo mladi negativen ali sovražen odnos do tega področja. Takšne trditve velikokrat slišimo v javnih razpravah. N&T sta kriva za večino zlega v modernih družbah, kot so onesnaževanje, uničevanje okolice, prekomerna poraba naravnih virov in celo konflikti. Ali res temelji odnos mladih na teh predpostavkah?

Veliko vprašanj v raziskavi ROSE daje luč na to temo. Rezultati nakazujejo, da ni splošne sovražnosti proti N&T med mladimi, niti v bogatih niti v revnejših državah. V splošnem je bilo podanih kar nekaj pozitivnih odgovorov:

- N&T sta pomembna za družbo
- Država potrebuje N&T
- N&T bosta našla zdravila za bolezni, kot so HIV/AIDS in rak
- Zaradi N&T bo več priložnosti za prihodnje generacije
- Zaradi N&T so naša življenja bolj zdrava, lažja in bolj udobna
- Nove tehnologije bodo omogočile bolj zanimive službe
- Prednosti N&T so večje kot škoda, ki jo lahko povzroči
- N&T bosta pomagala zmanjšati revščino in lakoto na svetu
- N&T povzročata večino okoljevarstvenih problemov

Večina učencev v večini držav (starih od 14-16 let) se strinja z zgoraj naštetimi trditvami, ne glede na to, da obstajajo zanimive razlike med državami ter med dečki in deklicami. V splošnem so dečki bolj pozitivno usmerjeni proti N&T (ali manj skeptični) kot deklice, prav tako so učenci v državah v razvoju bolj pozitivno usmerjeni kot učenci v bogatejših državah. Pomembno je, da je skupen odnos do N&T pozitiven.

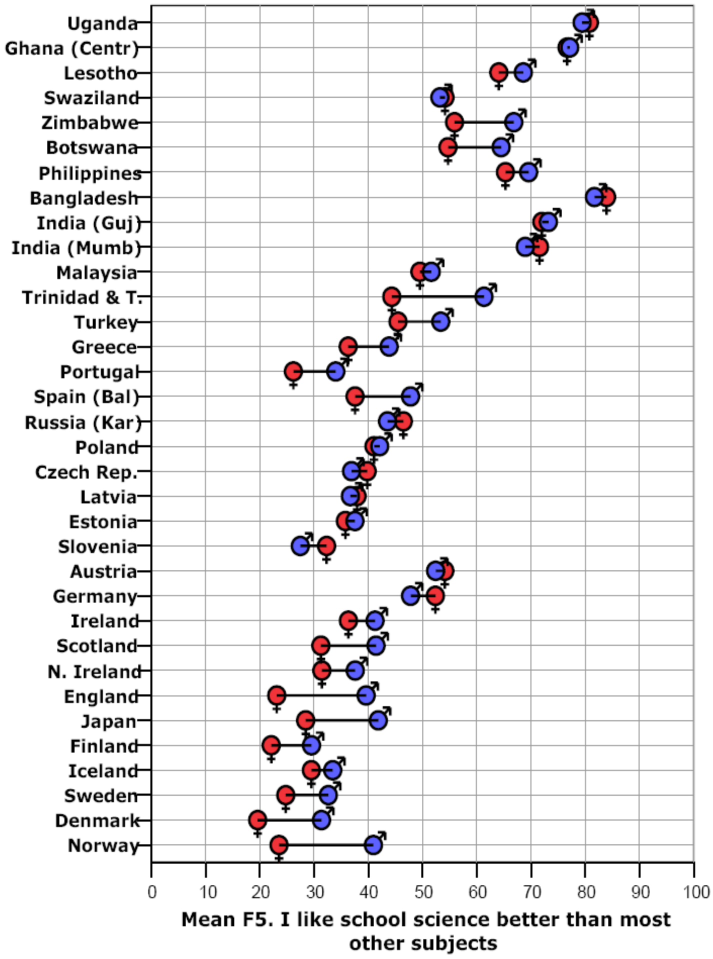


Slika 1: Naravoslovje in tehnika sta pomembna za družbo

Kot nam kaže Slika 1, deklice in dečki v vseh državah kažejo izrazito strinjanje s trditvijo, da sta naravoslovje in tehnika pomembna za družbo. Otroci v državah v razvoju se s to trditvijo bolj strinjajo, razlike med spoloma pa so zanemarljive

PROBLEMATIČEN ODNOS DO NARAVOSLOVJA IN TEHNIKE V ŠOLAH

Ne glede na to, da imajo učenci v vseh državah pozitiven odnos do vloge N&T v družbi, je odnos do N&T v konkretnih šolah različen.

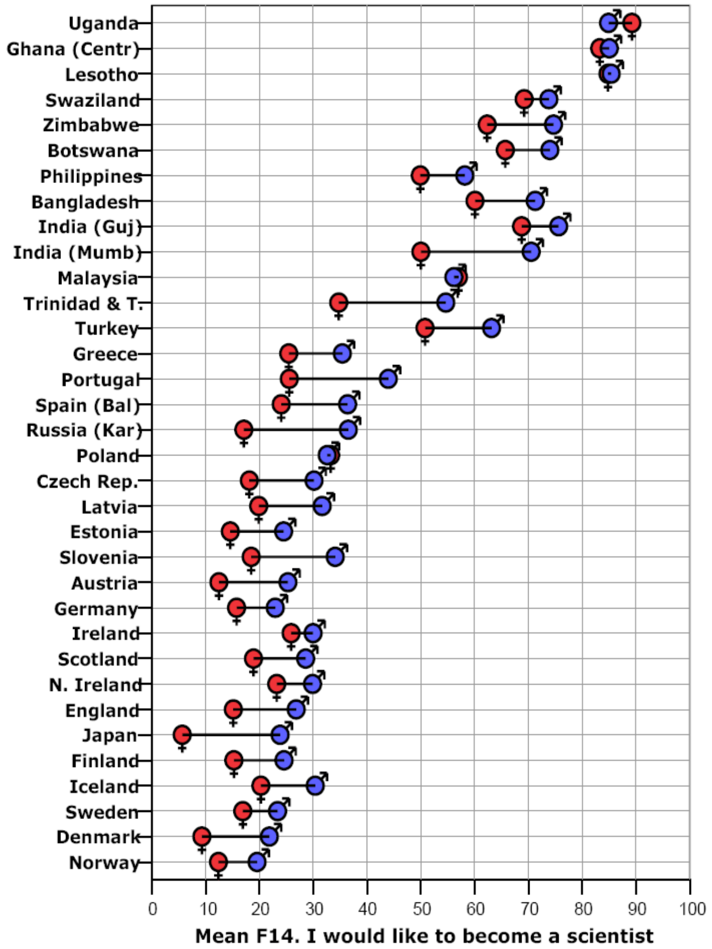


Slika 2: Raje imam naravoslovje kot druge šolske predmete

Slika 2 prikazuje velike razlike med učenci iz vseh koncev sveta glede njihovega odnosa do N&T. V splošnem imajo učenci v državah v razvoju radi N&T, medtem ko učenci v bogatejših delih sveta kažejo bolj negativen odnos. Opazimo lahko tudi velike razlike v spolu: v nekaterih državah deklice veliko bolj kot dečki zavračajo naravoslovje. Projekt ROSE vključuje tudi vprašanja o tem, kakšne koristi imajo učenci od naravoslovja v šoli, vendar za podrobno analizo tukaj ni prostora.

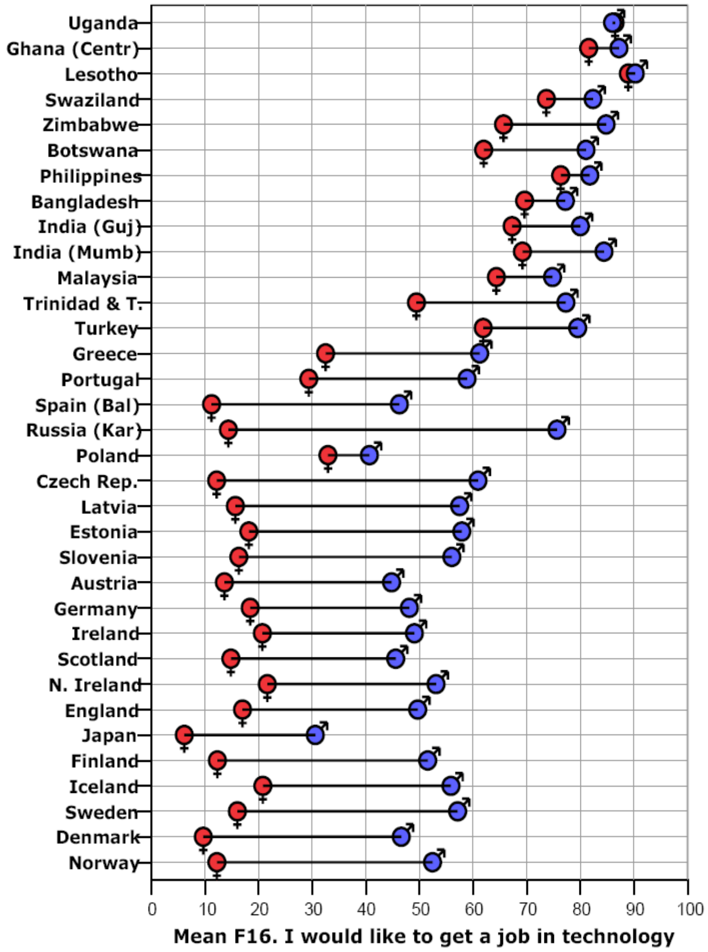
NENAKLONJENOST DO KARIERE V NARAVOSLOVJU IN TEHNIKI

Veliko vprašanj v projektu ROSE se nanaša na mlade in njihove poklicne želje. Tukaj predstavljamo le dva odgovora na preprosti vprašanji: ali učenec želi postati znanstvenik (Slika 3) in ali želi delati na področju tehnike (Slika 4).



Slika 3: Rad/-a bi postal/-a znanstvenik/-ca

Slika 3 nam prikazuje velike razlike med odgovori učencev iz bogatih držav in držav v razvoju. V slednjih imajo učenci veliko željo postati znanstveniki, medtem ko učenci iz držav OECD kažejo nenaklonjenost. Opazimo lahko tudi velike razlike v spolu, predvsem v državah OECD. V večini teh držav je bil povprečen odgovor deklic okrog 1,5 na 4-stopenjski lestvici, kar nam pove, da velika večina odklanja idejo, da bi postale znanstvenice.



Slika 4: Rad/-a bi se zaposlil/-a na področju tehnike

Slika 4 nam prikazuje podobno: zaposlitev na področju tehnike je veliko bolj privlačna za učence iz držav v razvoju kot iz bogatih držav. V razvitih, bogatih državah znaša povprečen odgovor za dečke okrog 2,5, medtem ko deklice kažejo izrazito negativen odnos. Vidimo tudi, da so dečki in deklice na Japonskem bolj negativno opredeljeni glede poklicne kariere s področja tehnike kot učenci iz drugih držav.

ZAKLJUČEK

Naš prispevek daje samo smernice in kratko informacijo glede projekta ROSE. Prikazujemo le štiri od 250 spremenljivk. Celotna študija je na voljo na naši spletni strani. Pred kratkim je bil predstavljen prvi doktorat, ki temelji na raziskavi ROSE (Schreiner, 2006), v katerem najdemo podrobno analizo o interesih mladih glede različnih področij naravoslovja in tehnike. Na podlagi te analize so predlagani tudi različni tipi učencev.

S projektom ROSE želimo spodbuditi razprave o pomembnosti N&T in njuni vlogi v izobraževanju in družbi. Raziskovalci iz različnih kulturnih ozadij so vključeni v samo raziskavo in razpravo. Mednarodno sodelovanje, mreženje in razvoj so ključnega pomena. Želimo si, da bi bilo izobraževanje iz N&T instrument ne samo za promocijo materialnega razvoja in blaginje, ampak tudi za razvoj osnovnih človekovih vrednot.

ABSTRACT

The purpose of this research paper is to investigate how interested primary school learners are in learning about natural topics within specific subject fields, and their wishes regarding future jobs and careers. Examining the existing lesson plans, it becomes evident that in grades one to nine natural topics are intertwined in different subject fields. A quantitative research has been performed in order to investigate the learners' wishes regarding learning about natural topics within different subject fields, the difference between the genders and their wishes regarding the profession. The data was acquired by means of a questionnaire. The findings suggest that in Slovenia the learners' interest in Natural science is minimal, nevertheless the girls are more interested than boys. The learners would like to learn more about the world of animals, non-scientific phenomena and information technology. However, they are not interested in physics. Regarding the choice of a profession, the findings suggest that in Slovenia the girls and boys are more interested in employments which will enable them to utilize their talents and abilities. They would like to work with people and make their own choices, and are not interested in working with tools and machines. The results are comparable to those in the western european countries.

Keywords: *curriculum, education, natural sciences, profession and career.*

UVOD

Že desetletje beležimo večanje vpisa na družboslovje in posledično relativno zmanjševanje le-tega na naravoslovnih in tehniških področjih. Vzrokov za to je veliko. Eden pomembnejših je, da so se morda spremenile vrednote mladih in posledično izbira poti izobraževanja, kariere ter načina življenja. Mladi imajo tudi različna in nejasna pričakovanja, kaj jih čaka po končanem izobraževanju. Svoj vpliv pa ima seveda tudi struktura gospodarstva in večanje števila delovnih mest v storitvenih dejavnostih. (Dolinšek idr. 2006).

S podobnimi „težavami” se srečujejo tudi v drugih državah Evrope. Vlade, pa tudi posamezne šole, poskušajo z različnimi pristopi povečati zanimanje za študij na področju naravoslovja in tehnike.

Bourdieu (1984, 144) omenja kolektivno razočaranje, ki izvira iz strukture neskladnosti med željami in resničnimi možnostmi, med družbeno identiteto, ki jo, kot se zdi, obljublja šolski sistem, ali identiteto, ki jo ponuja začasno, in družbeno identiteto, ki jo dejansko ponuja trg dela ter je vir nezadovoljstva z delom.

Mladi, pri katerih je družbeni sistem spodkopal družbeno identiteto in samopodobo, izobrazbeni sistem pa jih je odpravil z ničvrednim papirjem, ne najdejo druge poti ponovne vzpostavitve svoje osebne ter družbene integritete, kakor da vse odklanjajo.

V Sloveniji smo priča aktivnostim Ministrstva za visoko šolstvo, znanost in tehnologijo ter Ministrstva za delo, družino in socialne zadeve, ki poskušata ta gibanja obrniti predvsem z omejevanjem vpisa na družboslovne fakultete, še posebej poslovne in upravne.

Minister za visoko šolstvo, znanost in tehnologijo je v šolskem letu 2005/2006 obiskal vsa srednješolska središča z namenom, da bi osebno pripomogel k povečanju vpisa na fakultete z naravoslovnega področja. (Zupan 2005).

Takšnemu načinu prepričevanja in prizadevanjem ministra za visoko šolstvo, znanost in tehnologijo je oporekalo kar nekaj strokovnjakov.

Med drugim tudi dr. Krnel (2006, 6) poudarja, da so razvoju in posodobitvi pouka naravoslovja namenjene raznolike dejavnosti, a so učinki skromni. Razlog za te počasne in majhne premike je najbrž iskati prav v razdrobljenosti prizadevanj ter slabo opredeljenem cilju.

Krnel navaja: „Pogosto je že znotraj ene institucije delo neusklajeno in nepovezano. Večinoma je prepuščeno posamezniku, da se skozi svojo mrežo poznanstev in po svojih interesih razgleda po dejavnostih ter usmeritvah svojih kolegov na drugih področjih. Tako fiziki ne vedo, kaj razvijajo biologi, in ti ne vedo, kam se usmerjajo kemiki, vsi skupaj pa ne, kam težita skupna didaktika, teorija vzgoje in tako naprej." (Krnel 2006, 6).

Krnel (2006, 6) tudi pravi, da odločanje za naravoslovni študij ni odvisno le od uspešnosti propagande ministrstva za znanost in tehnologijo, temveč tudi od tega, kakšen je ter kakšen bo pouk naravoslovja v osnovnih in srednjih šolah.

Motiv za raziskavo v Sloveniji sloni na projektu ROSE („Razmišljanje, vrednote in prioritete mladih v povezavi z izobraževanjem na področju znanosti in tehnologij"), ki je nastal na podlagi študije SAS, katere nosilec je Svein Sjøberg in je bila pilotska študija projekta ROSE, ki ga je odobril raziskovalni svet na Norveškem. V projekt ROSE so preko mednarodnih raziskovalnih inštitucij: IOSTE, ESERA, in NARST povabili druge države. S projektom so seznanili tudi UNESCO. (Schreiner in Sjøberg, 2004).

Prve rezultate mednarodne raziskave ROSE oziroma prve primerjave med različnimi državami sta objavila nosilca raziskave. (Sjøberg, Schreiner, 2005). V članku so predstavili bistvo raziskave, podobnost med udeleženimi državami, povezava glede bodoče službe in usmeritev mladih.

Sjøberg ugotavlja, da je želja mladih po oblikovanju svoje kariere močno povezana s stopnjo razvoja določene države. V revnih državah je največji izziv povezan z izboljšanjem materialnih pogojev, ekonomsko rastjo, izboljšanjem zdravstvenega sistema ter s povečanjem blaginje. Razvoj družbe je glavna javno-politična tema in v tem pogledu sta znanost in tehnologija osnovni gonilni sili.

V letu 2006 je na podlagi obširnega zbiranja podatkov preko na ta način oblikovane mednarodne raziskave ROSE nastal (po besedah prof. Sjøberga) izredno kakovosten rezultat, doktorsko delo Camille Schreiner. (Schreiner, 2006).

Vzporedno s tem so raziskovalci znotraj projekta ROSE uporabili različne pristope vrednotenja rezultatov anket v nacionalnem okolju. Na podlagi tega je nastalo večje število objav. Največ rezultatov je bilo predstavljenih leta 2006 v okviru simpozija IAOSTE. V članku (Dolinšek, 2006) govori o krizi izobraževanja na področju študija tehnike v Sloveniji in EU.

Na Švedskem so v okviru raziskave definirali določene profile učencev, ki se nanašajo na njihovo zanimanje, poleg tega pa so predstavili tudi zanimivo nadaljevanje raziskave. (Oscarsson, 2006).

Finski predstavnik (Lavonen, 2006) je na podlagi uporabe faktorske analize predstavil raziskavo o tem, kako so karakteristike poklica pri učencih zadnjega razreda osnovne šole vezane na odločanje glede kariere. Zanimanje in poklicna usmeritev sta tesno povezani z učenjem ter izbiro kariere.

Rezultati iz Južne Afrike (Langenhoven, 2006) se nanašajo na raziskavo razlik med fanti in deklicami. Učenci južnoafriškega področja Western Cape kažejo pozitivno voljo za učenje šolske znanosti.

V Botsvani so naredili primerjavo med vrednotami učencev na srednjih šolah. (Yandila, 2006).

Glede dojemanja pomembnosti znanosti so rezultati pokazali, da učenci prepoznavajo pomembnost šolske znanosti za svoje življenje in bodočo kariero. Pokazali so, da cenijo znanost kot del svojega življenja in da bodo z učenjem znanosti dobili potrebne veščine ter znanja, ki jih potrebujejo, da bi se lahko spopadli z nenehno spreminjajočim se svetom.

Pri tem je potrebno omeniti še nekatere zanimive mednarodne primerjave, ena zadnjih je primerjava s Finsko. (Gaber, 2006).

V tem času je Finska s ponosom sprejela mednarodno potrditev (PISA 2000) uspešnosti svoje šole. Prej je dolgo veljalo, da pri reformiranju šolskega sistema naredijo »vse napake, ki jih naredijo Švedi, le da deset let pozneje«. Zdaj je njihov sistem »najboljši – najučinkovitejši« na svetu

NAMEN, CILJ IN TEZA RAZISKAVE

Skladno s predstavljenim raziskovalnim problemom smo definirali namen raziskave: ob naprej znanem metodološkem pristopu ugotoviti interes učencev devetih razredov osnovnih šol v Sloveniji za učenje vsebin naravoslovnih predmetov in želje glede bodoče službe ter kariere. Poleg tega želimo tudi opraviti primerjavo med osnovnošolskimi učnimi načrti (oziroma učnimi vsebinami) in ugotovitvami, pridobljenimi preko anketnih vprašanj (po metodologiji ROSE). Metodologija je podrobno predstavljena v publikaciji: „The Relevance of Science Education”. (http//www.ils.uio.no/english/rose/, 16. 2. 2007).

V Sloveniji do sedaj še ni raziskave, ki bi analizirala želje in prioritete mladih, povezane z izbiro šolanja ter s poklicno kariero. Glede na poznavanje objav in analiz s tega področja lahko govorimo, da je naša raziskava izvirna, saj bomo s pomočjo preverjene metodologije, prenesene v slovensko okolje, ugotovili želje učencev po učenju naravoslovnih vsebin in raziskali razlike med njihovimi željami glede na spol. Cilji, ki smo si jih postavili v raziskavi, so:

– Opraviti kritičen pregled ustreznih teoretičnih izhodišč in metodoloških pristopov s predlaganega področja.

– Ugotoviti, ali je pristop mednarodne raziskave ROSE ustrezen za izvedbo v slovenskem osnovnošolskem okolju.

– Prilagoditi metodološki pristop in izvesti anketiranje skladno s predlagano metodologijo.

– Ugotoviti interes učencev na področju vsebin naravoslovnih predmetov.

– Ugotoviti želje učencev glede bodoče službe in kariere.

Osnovna teza raziskave je: mladi se bolj odločajo za nadaljnje šolanje na področju družboslovja in njihove vrednote (oblikovane ob vsebinah osnovnošolskega izobraževanja, vplivih širšega družbenega okolja ter družbenih sprememb) niso prioritetno povezane z vsebinami izobraževanja ter s poklicem na področju naravoslovja in tehnike (znanosti in tehnologije).

METODA

Raziskava je bila opravljena na podlagi kvantitativne raziskave z uporabo anketnega vprašalnika zaprtega tipa, rezultati so analizirani z uporabo univariantne opisne statistike. V raziskavi smo uporabili pristop po mednarodnem projektu ROSE. Anketni vprašalnik, s katerim smo zbirali podatke, so v okviru mednarodne primerjalne raziskave ROSE razvili na Norveškem.

Osnovna oblika vprašalnika je v angleškem jeziku, razdeljen je na osem področij, sestavljajo ga zaprta in eno odprto vprašanje.

Vprašanja se nanašajo na interese učencev, odnose, načrte, poglede na znanost, tehnologijo, okoljevarstvene izzive itd. Pred uporabo vprašalnika v slovenskem prostoru so ga prevedli strokovnjaki (osnovnošolski profesorji angleščine).

Pri raziskavi ROSE v Sloveniji zasledujemo cilje, podane v predlogu mednarodne raziskave, in jih obenem navezujemo na specifične vsebine, ki se pojavljajo v okolju Slovenije, ter značilnosti našega izobraževalnega sistema. Za analizo zanimanja učencev na področju vsebin naravoslovnih predmetov smo rezultate ankete primerjali z učnimi vsebinami znotraj osnovnošolskih učnih načrtov.

Vprašalnik sestavlja deset sklopov vprašanj. Vse razen enega sestavljajo zaprta vprašanja. Pri zaprtih vprašanjih je uporabljena Likertova lestvica od 1 do 4. Ena pomeni popolno nestrinjanje, medtem ko pomeni štiri popolno strinjanje s trditvijo.

Odgovori se vrstijo v parih: se ne strinjam惘se strinjam, me ne zanima惘me zelo zanima, nepomembno惘zelo pomembno, nikoli惘vedno. Odprto vprašanje je sestavljeno iz dveh delov (prvi sprašuje, kaj bi radi delali kot znanstveniki, v drugem pa sprašuje po razlogih za to izbiro). Na področju z odprtim vprašanjem „Jaz kot znanstvenik” so učenci opisali, kaj bi radi delali kot znanstveniki in kaj bi radi raziskovali.

Vprašalnik so pred uporabo pregledali strokovnjaki (osnovnošolski profesorji) s posameznega predmetnega področja. Zaradi ugotavljanja razumevanja je bil vprašalnik pred uporabo preizkušen tudi na slovenskih osnovnošolcih. Odpravljeni so bili nerazumljivi pojmi, kar je zagotavljalo ustreznost raziskovalnega pristopa za Slovenijo.

Anketiranje se je izvajalo ob prisotnosti odgovorne osebe v šoli, kar je zagotovilo velik odstotek vrnjenih vprašalnikov.

Vprašalnik s katerim smo zbirali podatke, zajema osem področij z različnimi vprašanji. Področja so označena s črkami po abecednem vrstnem redu od A do J, izpuščena je črka Č:

— področje „Stvari, o katerih želim vedeti več” (108 vprašanj) se nahaja pod črkami A, C in E in zajema vprašanja, ki se nanašajo na predmetna področja z naravoslovnimi vsebinami, učenci pa se jih učijo v šoli,

— področje „Moj bodoči poklic” (26 vprašanj) pod črko B zajema vprašanja, ki sprašujejo o pomembnosti podatkov pri izbiri poklica,

— področje „Okoljevarstveni izzivi in jaz” (18 vprašanj) pod črko D zajema vprašanja o okoljevarstvenih izzivih,

— področje „Moje poznavanje znanosti” (naravoslovni predmeti, 16 vprašanj) pod črko F zajema področje naravoslovnih predmetov, o katerih se učijo v šoli,

— področje „Moje mnenje o znanosti in tehnologiji” (16 vprašanj) pod črko G pokriva področje znanosti in tehnologije,

— področje „Moje izvenšolske izkušnje” (61 vprašanj) pod črko H zajema trditve, ki se nanašajo na izvenšolske izkušnje,

— področje „Jaz kot znanstvenik” pod črko I zajema odprto vprašanje, ki sprašuje učence, kaj bi počeli kot znanstveniki in zakaj,

— področje „Koliko knjig imate doma” pod črko J sprašuje učence po številu knjig, ki jih imajo doma.

Camilla Schreiner in Svein Sjøberg (2004, 54—70) v priročniku „ROSE The Relevance of Science Education” pojasnjujeta posamezna področja v vprašalniku.

Ciljna populacija so bili učenci zaključnih razredov osnovne šole. Praviloma bi morali biti stari 14 let. Otroci, ki so bili zajeti v raziskavi, bi se naj rodili leta 1991. Razlike v letih se lahko pojavijo iz različnih vzrokov: mlajši od 14 let so lahko otroci, ki so se predčasno vpisali v šolo (zdaj so stari 13 let), starejši so tisti otroci, ki so razred ponavljali ali pa so se vpisali v šolo, ko so bili starejši od šestih let.

Za določanje vzorca smo izhajali iz načela, da je raziskava veljavna, če je opravljena na dovolj velikem vzorcu. Po metodologiji projekta ROSE je dovolj velik vzorec, če je v raziskavo vključenih vsaj 1000 učencev. Po podatkih MŠŠ je v deveti razred vpisanih 20.716

učencev, ki so razporejeni v 1004 oddelke, povprečno je v oddelku 20,6 učencev. V vzorec je bilo potrebno vključiti vsaj 60 ali 13,4 % šol, to pomeni, da je bilo v raziskavo vključenih 1236 učencev oziroma 5,9 % celotne populacije učencev. S predpostavko, da bomo dobili 80 % ustreznih odgovorov, je bilo v raziskavo vključenih 988 učencev. Šole so bile izbrane po načelu naključnega vzorčenja.

IZVEDBA

S formalnim dopisom Fakultete za management, Univerze v Kopru smo v februarju 2006 izbrane šole obvestili in jih povabili k sodelovanju. Vsak član projektne skupine je izvedel anketiranje na nekaj šolah, pred izvedbo ankete je zadolženi član projektne skupine vzpostavil telefonski stik s šolo. Tako smo dobili potrditev za sodelovanje oseminpetdeset šol, ravnatelja na dveh šolah sta izvedbi raziskave nasprotovala.

Šole so za izvedbo anketiranja odobrile eno šolsko uro (45 minut), na vsaki je bil nekdo določen za odgovorno osebo. Na posameznih šolah so odgovorni učitelji izvedbo v celoti prepustili članom projektne skupine. Z izvedbo raziskave smo pričeli 20. februarja, vse vprašalnike pa smo zbirali do 15. marca 2006. Po končanem anketiranju je vsak član zbrane vprašalnike svojih šol poslal na eno mesto, kjer so se podatki vnašali in pozneje obdelovali. Vsaki sodelujoči šoli smo priskrbeli tudi pisno gradivo o raziskavi in z ravnatelji opravili kratek intervju. Tako ravnatelji kot učenci so raziskavo vzeli resno. Učenci so vprašalnike reševali z zanimanjem, potreben čas za izpolnjevanje je bil v povprečju 20−40 minut. Časovne težave je imelo nekaj učencev, ki so slabše brali ali pa niso imeli dovolj koncentracije (opredeljeni kot učenci s posebnimi potrebami, te vprašalnike smo izločili iz raziskave).

Po opravljenem anketiranju smo ugotovili, da je bilo v vzorec zajetih 1187 učencev, kar je 96,03 % predvidenega vzorca ali 20,46 učenca na oddelek. V raziskavi je sodelovalo 537 dečkov in 547 deklic. Starost se je gibala od 13 do 16 let:

- 13 let: 7 učencev ali 0,58 % vzorca,
- 14 let: 853 učencev 71,6 % vzorca,
- 15 let: 214 učencev 18,02 % vzorca,
- 16 let: 8 učencev 0,67 % vzorca,
- 89 učencev ali 7,49 % vzorca iz neznanih razlogov ni bilo v šoli.

Iz analize smo 14 anketnih listov (1,17 % vzorca) izločili kot neveljavne (niso bili ustrezno izpolnjeni ali pa so učenci pustili prazne cele strani), kar pomeni, da je v raziskavi sodelovalo 1084 učencev oziroma da je bilo 91,32 % vprašalnikov iz celotnega vzorca veljavnih skladno z metodologijo, uporabljeno v raziskavi ROSE.

REZULTATI

Vprašalnik v poglavju „Stvari, o katerih želim vedeti več” zajema vprašanja, ki se nanašajo na zanimanje za učenje vsebin naravoslovnih predmetov, kot so: kemija, biologija, fizika, geografija, okoljska vzgoja, astronomija, biologija z botaniko, vzgoja za zdravje in vsebine, vezane na živalski svet. Znotraj predmetnih skupin osnovne šole se pojavijo tudi skupine splošnega značaja (znanost nasploh, mistični pojavi ...).

Vprašalnik je sestavljen tako, da učence sprašuje: „V kolikšni meri bi se radi učili o naslednjih vsebinah?”

Vprašanja se nahajajo pod črkami A, C in E in zajemajo 108 različnih trditev, na podlagi katerih ugotavljamo, katere so stvari, o katerih bi učenci želeli vedeti več.

Preglednica 1 prikazuje primerjavo povprečnih vrednosti odgovorov na vprašanja s področja „Stvari, o katerih želim vedeti več". Povprečne vrednosti se gibljejo znotraj intervala 1,62 in 3,17. Vrednosti, ki izstopajo od vrednosti 2,5 navzgor, pojasnjujejo stvari, o katerih želijo učenci vedeti več in jih zanimajo bolj kot stvari, ki padejo pod povprečje. Ocene pod 2,5 pojasnjujejo stvari, ki učence zanimajo malo ali pa sploh ne.

Preglednica 1: Posamezna vprašanja z najnižjimi in najvišjimi povprečnimi vrednostmi s področja „Stvari, o katerih želim vedeti več"

Zap. št.	Vprašanje	Skupaj	Deklice	Fantje
A40	Kako telovaditi, da obdržimo telo močno in v formi	3,17	3,28	3,06
A34	Občutek breztežnosti v vesolju	2,96	2,82	3,10
A23	Kako lahko meteorji, kometi ali asteroidi povzročijo katastrofe	2,96	2,93	3,02
A02	Kemikalije, njihove lastnosti in kako reagirajo	2,08	2,12	2,05
A15	Kako rastejo in se razmnožujejo rastline	1,94	2,02	1,86
A17	Kaj so atomi in molekule	1,91	1,95	1,86
C13	Zakaj sanjamo, ko spimo, kaj lahko pomenijo sanje	3,16	3,46	2,86
C08	Možnost življenja izven Zemlje	3,13	3,10	3,16
C07	Kako delujejo računalniki	3,05	2,70	3,38
C14	Duhovi in čarovnice – ali obstajajo	2,44	2,79	2,09
C12	Alternativno zdravljenje (akupunktura, homeopatija, joga) in njegov učinek	2,32	2,68	1,97
C01	Kako se surova nafta spremeni v druge materiale	1,85	1,56	2,14
E10	Kako nuditi prvo pomoč in uporabiti osnovno	3,06	3,23	2,88
E09	Spolno prenosljive bolezni in kako se zaščititi pred njimi	3,04	3,17	2,90
	Kaj vemo o HIV-u/AIDS-u in kako ga nadzirati	3,00	3,18	2,81
E19	Organsko in ekološko kmetovanje brez pesticidov ter fertilizatorjev	2,00	1,90	2,10
E33	Prednosti in možna tveganja oz. nevarnosti sodobnih metod kmetovanja kmetovanja	1,86	1,70	2,02
E01	Simetrale in vzorci na listih ter rožah	1,62	1,75	2,02

Učenci so pri odgovarjanju na vprašanja razvrščali odgovore na podlagi zanimivosti. Kljub temu da se lahko vprašanja iz vprašalnika združujejo v različne skupine, smo jih združevali po predmetih in vsebinah, zajetih v učnih načrtih za obvezne in izbirne predmete v slovenskih osnovnih šolah. Podlaga za združevanje vprašanj v predmetne skupine je bila primerjalna analiza učnih načrtov in vprašanj iz vprašalnika. Vsebine, ki jih je zajemalo posamezno vprašanje v vprašalniku, smo poiskali v posameznem učnem načrtu. Ker se vsa vprašanja ne nanašajo na učne vsebine, smo jih združevali po skupinah, ki so povezane med seboj (znanost nasploh, neznanstveno področje). Da smo vprašanja razvrstili v ustrezne predmetne skupine, so preverili in potrdili profesorji za posamezna predmetna področja.

Preglednica 2 prikazuje primerjavo vseh 12 predmetnih področij, ki smo jih oblikovali na podlagi analize učnih načrtov za naravoslovne predmete v osnovni šoli in vprašanj v vprašalniku iz projekta ROSE. Vsebine, ki se pojavljajo v raziskavi, se učenci učijo v šoli pri osnovnih in izbirnih predmetih ali področjih, ki niso vezana na določen predmet. Prikazana je primerjava povprečnih vrednosti posameznih predmetnih področij – skupaj in ločeno po spolu.

Iz preglednice 2 je razvidno, da učence najbolj zanima področje, ki opredeljuje mistične pojave (povp. = 2,83), sledi mu področje iz živalskega sveta (povp. = 2,74) in računalništvo ter informatika (povp. = 2,72). Zanimivo je, da učencev ne zanimajo fizika (povp. = 2,42), okoljska vzgoja (povp. = 2,38), kemija (povp. = 2,20) in rastline (povp. = 2,08).

Področja astronomija (povp. = 2,70), vzgoja za zdravje (povp. = 2,68), biologija človeka (povp. = 2,57, povp. fant. = 2,42, povp. dek. = 2,72), geografija (povp. = 2,47) in znanost nasploh (povp. = 2,44) so se po zanimanju učencev razvrstila v sredino lestvice. Iz analize povprečnih vrednosti področja znanosti nasploh lahko ugotavljamo, da fante znanost bolj zanima kot deklice, čeprav razlike niso velike (povp. fant. = 2,50, povp. dek. = 2,39).

V primerjavi med spoloma vidimo tudi, da so razlike med posameznimi področji minimalne. So pa področja, pri katerih so razlike izrazite: neznanstveni pojavi (povp. fant. = 2,62, povp. dek. = 3,04), računalništvo in informatika (povp. fant. = 3,07, povp. dek. = 2,38) in fizika (povp. fant. = 2,62, povp. dek. = 2,17). Razlike se pojavijo na podlagi interesa posamezne skupine učencev.

Če upoštevamo, da je vrednost 2,5 tista meja, ko govorimo, da učence določeno področje zanima (vrednost nad 2,5) in ne zanima (pod 2,5), lahko pri povprečni vrednosti 2,51 trdimo, da je zanimanje za naravoslovne vsebine v slovenskih osnovnih šolah na meji, ko govorimo, da učence naravoslovne vsebine zanimajo. Če primerjamo povprečno vrednost odgovorov deklic (povp. dek. = 2,5) z mejo zanimanja, ki prav tako znaša 2,5, ne moremo trditi, da deklice vsebine naravoslovja zanimajo ali da jih te vsebine ne zanimajo. V tem primeru bi lahko sklepali le za posamezna področja. Ugotavljamo lahko, da spadajo področja: neznanstveni (mistični) pojavi, živalski svet, računalništvo in informatika, astronomija, vzgoja za zdravje ter biologija človeka v področje zanimanja.

Področja: geografija, znanost nasploh, fizika, okoljska vzgoja, kemija in rastline ter človek pa spadajo v področje nezanimanja učencev za posamezna področja (vrednosti so pod 2,5).

Preglednica 2: Vrednosti po posameznih področjih skupaj in ločeno po spolu

Področje	Povp. skupaj	Povp. Fantje	Povp. Deklice
neznanstveni (mistični) pojavi	2,83	2,62	3,04
živalski svet	2,74	2,71	2,77
računalništvo in informatika	2,72	3,07	2,38
astronomija	2,70	2,82	2,59
vzgoja za zdravje	2,68	2,46	2,90
biologija človeka	2,57	2,42	2,72
geografija	2,47	2,48	2,47
znanost nasploh	2,44	2,50	2,39
fizika	2,42	2,67	2,17
okoljska vzgoja	2,38	2,43	2,33
kemija	2,20	2,25	2,16
rastline	2,08	2,07	2,09

Rezultati v preglednici 3, kjer so vprašanja iz sklopa „Moj bodoči poklic", v vprašalniku so pod črko B, merijo pa splošne interese v karakteristiki služb, so prikazani ločeno za deklice in fante.

Na podlagi povprečnih vrednosti s področja „Moj bodoči poklic", katerega podatki so pod črko B, ugotavljamo, da bi učenci, predvsem deklice, v svojem poklicu radi delali nekaj, kar je za posameznika pomembno in smiselno (B15 – povp. dek. = 3,71, povp. fant. = 3,40). Trditev B15 (Delati nekaj, kar je zame pomembno in smiselno) se je uvrstila na vrh povprečnih vrednosti v primerjavi za deklice. Takoj za trditvijo B15 (Delati nekaj, kar je zame pomembno in smiselno) se razporedi trditev B9 (Uporaba svojih talentov in sposobnosti – povp. dek. = 3,55, povp. fant. = 3,18). Ob primerjavi povprečnih vrednosti za fante ugotavljamo, da bi fantje najraje delali v poklicih, kjer bi lahko pomagali drugim ljudem, kar potrjuje trditev B2 (Pomoč drugim ljudem – povp. fant. = 3,54).

Drugo mesto po pomembnosti pri odločanju za poklic zaseda pri fantih trditev B17 (Imeti veliko časa za svojo družino – povp. fant. = 3,50). Fantje in deklice bi radi v svoji službi tudi veliko zaslužili, kar potrjujejo povprečne vrednosti pri trditvi B20 (Zaslužiti veliko denarja – povp. dek. = 3,33, povp. fant. = 3,33), ki so za obe skupini enake.

Zanimiva je ugotovitev, da so trditve: B24 (Postati šef v svoji službi), B22 (Postati slaven), B4 (Delo na področju zaščite okolja), B6 (Gradnja in popravilo predmetov z lastnimi rokami) ter B7 (Delo s stroji ali z orodji) na dnu vrednostne lestvice, gledano z osnove povprečnih vrednosti.

Pri vprašanju o delu s stroji in z orodji je pričakovano opazna največja razlika med spoloma v prid fantov (povp. fant. = 2,64, povp. dek. = 1,40). Na podlagi podanih podatkov lahko tudi ugotavljamo, da deklice ne želijo delati v poklicih, v katerih bi lahko uporabljale fizično moč in da je pri fantih želja po takšnih poklicih večja.

Preglednica 3: Povprečne vrednosti vprašanj področja B (Moj bodoči poklic)

Št.	Vprašanje	Sku.	Dek.	Fan.
B15	Delati nekaj, kar je zame pomembno in smiselno	3,55	3,71	3,39
B17	Imeti veliko časa za svojo družino	3,46	3,41	3,50
B20	Zaslužiti veliko denarja	3,43	3,33	3,54
B25	Razvijati in izboljševati svoja znanja in sposobnosti	3,39	3,42	3,36
B19	Delati na takšnem delovnem mestu, kjer se pogosto dogaja	3,38	3,46	3,30
B09	Uporaba svojih talentov in sposobnosti	3,36	3,54	3,18
B16	Delati nekaj, kar je v skladu z mojim prepričanjem	3,34	3,54	3,14
B13	Sprejemati svoje odločitve	3,30	3,5	3,12
B12	Imeti veliko časa za svoje prijatelje	3,30	3,30	3,29
B23	Imeti veliko časa za svoje konjičke, aktivnosti in interese	3,11	3,12	3,11
B14	Delovati neodvisno od drugih ljudi	3,06	3,22	2,90
B02	Pomoč drugim ljudem	3,04	3,31	2,77
B26	Delati kot del skupine z mnogimi ljudmi okoli sebe	2,99	3,11	2,87
B11	Predstavljanje novih idej	2,95	2,98	2,91
B01	Raje delam z ljudmi kot s stvarmi	2,85	3,19	2,51
B18	Delati nekaj, kar vključuje veliko potovanj	2,83	2,93	2,74
B10	Izdelovanje, oblikovanje ali izumljanje	2,82	2,72	2,91
B24	Postati »šef« v svoji službi	2,73	2,53	2,92
B21	Nadzorovati ostale ljudi	2,59	2,46	2,72
B03	Delo z živalmi	2,50	2,63	2,37
B22	Postati slaven	2,42	2,31	2,53
B08	Umetniško in ustvarjalno delo v umetnosti	2,38	2,67	2,11

B05	Delo z nečim lahkim in preprostim	2,34	2,29	2,38
B04	Delo na področju zaščite okolja	2,27	2,31	2,24
B06	Gradnja in popravilo predmetov z lastnimi rokami	2,07	1,63	2,50
B07	Delo s stroji ali z orodji	2,03	1,40	2,64

Iz rezultatov opisne statistike povprečnih vrednosti za področje F „Učenje o naravoslovju" (preglednica 4) lahko ugotavljamo, da se učenci s trditvijo F2 (Naravoslovje je zanimivo) strinjajo, kar dokazujejo povprečne vrednosti za omenjeno trditev (povp. = 2,86). Učenci pa se ne učijo naravoslovja samo zato, ker jim je zanimivo ampak tudi zato, ker menijo, da jim bo koristilo. To dokazujejo povprečne vrednosti za trditev F7 (Stvari, ki se jih v šoli naučim pri naravoslovju, mi bodo koristile v vsakdanjem življenju – povp. = 2,89). V primerjavi med spoloma je deklicam naravoslovje bolj zanimivo, prav tako pa dajejo deklice večji poudarek koristnosti naravoslovja kot fantje.

Iz rezultatov lahko ugotovim, da se tako fantje kot deklice ne strinjajo s trditvijo F6 (Mislim, da bi se v šoli morali vsi učiti o naravoslovju – povp. = 2,20), čeprav imajo deklice nekoliko bolj pozitiven odnos do naravoslovja kot fantje. Rezultati povprečnih vrednosti pri trditvi F1 (Naravoslovje je zahteven predmet) kažejo, da za učence naravoslovje ni zahteven predmet. Učenci z rezultati izkazujejo tudi, da naravoslovja nimajo najraje, kar se vidi pri trditvi F5 (Naravoslovje imam raje kot vse ostale predmete – povp. = 1,97) in da ga v šoli ne želijo veliko, kar je razvidno pri trditvi F15 (V šoli bi imel čim več naravoslovja – povp. = 1,90). Iz rezultatov povprečnih vrednosti (povp. = 2,16) za trditev F16 (Rad bi se zaposlil v poklicu, povezanem s tehnologijo) ugotavljamo, da učenci ne izkazujejo želje po poklicih, povezanih s tehnologijo. Če primerjamo rezultate povprečnih vrednosti ločeno po spolu za omenjeno trditev ugotavljamo, da fante, za razliko od deklic, zanimajo zaposlitve, povezane s tehnologijo (povp. fant. = 2,68, povp. dek. = 1,63).

Izhajajoč iz dejstev, da se osnovna šola zadnjih deset let spreminja, s tem posledično tudi učni načrti za posamezne predmete, učenci pa se glede na rezultate raziskave še vedno ne želijo učiti naravoslovnih vsebin, bo potrebno na področju naravoslovja poiskati dodatne rešitve za večje zanimanje učencev za te vsebine. To priložnost imajo strokovnjaki v Sloveniji že sedaj, ko se učni načrti ponovno posodabljajo.

Preglednica 4: Povprečne vrednosti področja F (Učenje o naravoslovju)

Št.	Vprašanja	Sku.	Dek.	Fan.
F7	Stvari, ki se jih v šoli naučim pri naravoslovju, mi bodo koristile	2,89	2,99	2,79
F2	Naravoslovje je zanimivo	2,86	2,99	2,73
F13	Naravoslovje me je naučilo, kako bolje skrbeti	2,70	2,83	2,58
F11	Naravoslovje je povzročilo, da bolj cenim naravo	2,68	2,79	2,57
F3	Naravoslovje je zame nezahtevno	2,68	2,76	2,59
F10	Naravoslovni predmeti so povečali mojo radovednost	2,57	2,65	2,48

F12	Naravoslovje me je naučilo o pomembnosti	2,52	2,56	2,47
F4	Naravoslovje mi je odprlo oči za nove in zanimive poklice	2,38	2,50	2,26
F8	Področja naravoslovja, o katerih se učim v šoli, bodo izboljšala	2,37	2,41	2,33
F1	Naravoslovje je zahteven predmet	2,29	2,29	2,3
F6	Mislim, da bi se v šoli morali vsi učiti o naravoslovju	2,19	2,30	2,08
F16	Rad bi se zaposlil v poklicu povezanim s tehnologijo	2,16	1,63	2,67
F5	Raje imam naravoslovje kot vse ostale predmete	1,97	2,03	1,90
F15	V šoli bi imel čim več naravoslovja	1,89	1,92	1,86
F9	Naravoslovni predmeti so vplivali na to, da sem kritičen	1,85	1,81	1,89
F14	Rad bi postal znanstvenik	1,84	1,66	2,03

Primerjava pri vprašanju B1 (Raje delam z ljudmi kot s stvarmi) nam kaže visoko zanimanje za delo z ljudmi v vseh primerjanih državah. Rezultati tudi kažejo, da je v vseh primerjanih državah delo z ljudmi zanimivejše za deklice kot za fante, saj so rezultati povprečnih vrednosti odgovorov deklic v vseh državah višji kot pri fantih. Ob primerjavi Slovenije z drugimi državami lahko ugotavljamo, da so rezultati v Sloveniji podobni kot v ostalih državah, le da so razlike med fanti in deklicami v manj razvitih državah manjše. V državi Malavi razlik v povprečnih vrednosti med fanti in deklicami skoraj ni, so pa najvišje med vsemi sodelujočimi državami.

Iz primerjave odgovorov na vprašanje B7 (Delo s stroji ali z orodji) je razvidno, da je zanimanje za delo z orodji zanimivo za otroke v nerazvitih državah, v evropskih pa se deloma za delo z orodji zanimajo le fantje. Deklic iz evropskih držav delo z orodji skorajda ne zanima. Deklice v Sloveniji so praktično najbolj nezainteresirane za delo z orodji. Ob primerjavi rezultatov povprečnih vrednosti odgovorov (ločeno po spolu) lahko ugotavljamo, da obstajajo v evropskih državah tudi velike razlike med spoloma. Zainteresiranost fantov za delo s stroji ali z orodji je večja kot pri deklicah.

Podobno kot v Sloveniji kažejo rezultati tudi na Danskem, Švedskem, Finskem in v ostalih evropskih državah. Delo s stroji ali z orodji najbolj zanima učence v državi Malavi, Ugandi in ostalih nerazvitih državah, vključenih v projekt ROSE.

Preglednica 5: Primerjava odgovorov na vprašanji B1 (Raje delam z ljudmi kot s stvarmi) in B7 (Delo s stroji ali z orordji) s področja B : Moj bodoči poklic

Država	Deklice	Fantje
Malawi	3,76	3,74

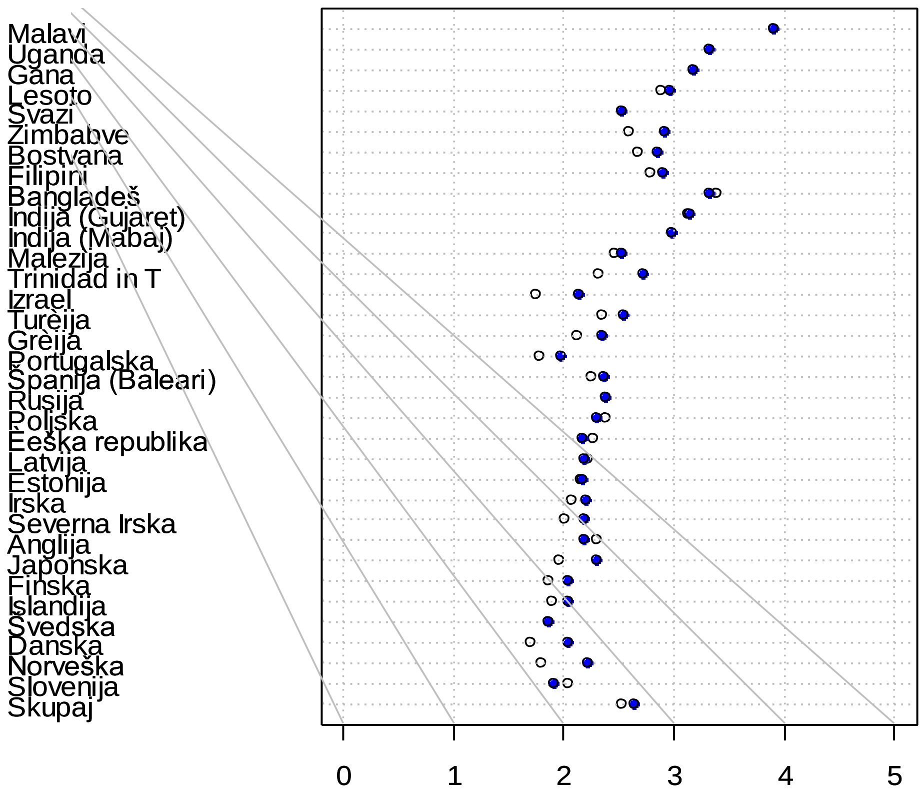
Slovenija	1,41	2,64

Primerjava pri vprašanju F5 (Naravoslovje imam raje kot vse ostale predmete) kaže, da učencev v razvitih državah naravoslovje ne zanima in da ga nimajo raje od drugih predmetov. Nasprotno se kaže v nerazvitih državah. Razlike med spoloma niso velike. Pri tej trditvi zelo izstopa država Malavi. V grafu (Slika 1) lahko opazimo minimalno odstopanje v povprečnih vrednostih. V večini držav so povprečne vrednosti fantov višje od povprečnih vrednosti deklic. Za razliko od večine držav imajo pri trditvi F5 (Naravoslovje imam raje kot vse ostale predmete) deklice v Sloveniji višje povprečne vrednosti od fantov.

Raje imam naravoslovje kot vse ostale predmete



Slika 1: Primerjava odgovora na vprašanje F5 (Raje imam naravoslovje kot vse ostale predmete) s področja F: Učenje o naravoslovju (fantje temno, deklice svetlo)

SKLEPNE UGOTOVITVE IN ZAKLJUČEK

Pri izvedbi raziskave smo sledili raziskovalnim ciljem in potrjevanju postavljene teze.

Ob pregledu teoretičnih izhodišč in metodoloških pristopov smo ugotovili, da je ponujeni pristop mednarodne raziskave ROSE ustrezen za izvedbo raziskave v slovenskem osnovnošolskem okolju. Ustreznost smo potrdili na osnovi poskusne uporabe vprašalnika na slovenskih osnovnošolcih.

Ugotovitve na podlagi povprečnih vrednosti odgovorov na vprašanja, razvrščena na posamezna predmetna področja v sklopu „Stvari, o katerih želim vedeti več", v vprašalniku pod črkami A, C in E, kažejo minimalno zanimanje učencev za učenje naravoslovnih vsebin pri posameznem predmetnem področju.

Na podlagi ugotovitev povprečnih vrednosti odgovorov na vprašanja lahko sklepamo, da se učenci ne želijo učiti vsebin, ki so zajete v predmetnih področjih fizike, okoljske vzgoje, kemije in rastlin.

Ugotavljamo, da se učenci v šoli ne želijo učiti naravoslovja saj ga nimajo raje kot ostalih predmetov. Rezultati raziskave in ugotovitve nam lahko vzbudijo dvom v pravilen izbor vsebin v učnih načrtih za posamezna predmetna področja.

Skladno z ostalimi cilji raziskave smo tudi ugotavljali: *„Kakšne so želje glede bodoče službe in kariere."*

Ob analizi rezultatov pri vprašanjih, ki se nanašajo na bodoči poklic, lahko ugotavljamo, da se v Sloveniji dekleta in fantje zanimajo za službo, v kateri bodo lahko uporabili svoje talente in sposobnosti. Radi bi delali z ljudmi in sprejemali svoje odločitve. Deklic delo z orodji in s stroji ne zanima. Pri tem vprašanju na področju B (Moj bodoči poklic) prihaja tudi do največjih razlik v povprečnih vrednostih odgovorov med fanti in deklicami.

Iz primerjave posameznih vprašanj med državami smo ugotovili, da se povprečne vrednosti odgovorov učencev v Sloveniji ne razlikujejo veliko od povprečnih vrednosti odgovorov učencev iz drugih držav v Evropi. Učence v nerazvitih državah naravoslovne vsebine bolj zanimajo kot učence v evropskih državah. Ugotovili smo tudi, da so razlike povprečnih vrednosti odgovorov med fanti in deklicami v Sloveniji podobne razlikam učencev v ostalih evropskih državah.

Ker raziskava zraven področja znanosti in tehnologije zajema še izkušnje učencev izven šole ter področje poklicnega odločanja, lahko dobljene rezultate uporabimo pri načrtovanju prihodnosti in oblikovanju šolske vizije.

Podatki, pridobljeni v raziskavi, in študij literature so nam odprli nova vprašanja ter dileme. Pripeljali so nas tudi do ugotovitev in priporočil, ne dovoljujejo pa sklepov, ki bi dali celovit odgovor na delovanje šolskega sistema oziroma na dileme o željah po učenju naravoslovnih vsebin.

Na podlagi rezultatov in ugotovitev mednarodne raziskave ROSE, da se učenci v Sloveniji ne želijo učiti naravoslovnih vsebin, odpiramo možnost nadaljnjih raziskav na nacionalni in internacionalni ravni, ki bi ugotavljale vzroke za takšno nezainteresiranost učencev za naravoslovne vsebine.

Ugotovitve so lahko tudi podlaga za analizo ustreznosti učnih vsebin znotraj učnih načrtov predmetnih skupin z naravoslovnimi vsebinami. Prav tako pa so lahko podlaga za spreminjanje kurikuluma. Ker je iz rezultatov razvidno, da se učenci ne želijo učiti naravoslovnih vsebin, radi pa bi več izvedeli s področij neznanstvenih pojavov, računalništva in astronomije, bi morda bilo vredno razmišljati v smeri „personaliziranega” kurikuluma.

Zanimivo bi bilo tudi:

惘ugotavljati kakšne so bistvene razlike med različnimi državami in kulturami ter

惘kako na odločanje mladih vplivajo oblika poučevanja, učni načrt in podobno,

惘 povezati rezultate projekta ROSE z drugimi raziskavami (TIMSS, PISA, Eurobarometer),

惘 na podlagi multi-variantne (faktorske) analize identificirati posamezne faktorje, ki vplivajo na odgovore,

惘 grupirati podatke ((cluster analysis) po vsebini (učni predmeti, regije, mesto − podeželje)),

惘narediti kvalitativno analizo tega, kako so anketiranci razumeli vprašanja.

ABSTRACT

The National Education Institute carried out monitoring of science instruction in grade 7 of elementary school in the academic year 2008/09. The methods employed were classroom observation, interviews with teachers and surveys involving teachers and learners. The findings show that syllabus goals are achieved satisfactorily and that the learners have positive attitudes towards science in this grade. Also, the instruction is a great deal based on active involvement of learners, such as experimental work. However, this kind of instruction is guided by teachers to a great extent. In the future teacher education should be focused on aspects of didactic differentiation and individualisation of instruction and on inquiry-based approaches to learning.

Keywords: *Teaching science, elementary school, experimental work, differentiated instruction*

UVOD

Zavod RS za šolstvo je spomladi 2009 na vzorcu tridesetih osnovnih šol izvajal spremljavo pouka pri izbranih predmetih v 7. razredu, med katerimi je bilo vključeno tudi naravoslovje. Pri tem je bil poseben poudarek na ugotavljanju: zastopanosti aktivnih metod dela pri pouku naravoslovja, s posebnim poudarkom na izvajanju eksperimentalnega dela; v kolikšni meri učitelji upoštevajo razlike med učenci z vključevanjem didaktične diferenciacije in individualizacije; s katerimi težavami se srečujejo učitelji pri poučevanju naravoslovja.

METODA

Spremljava je vključevala opazovanje pouka, intervjuje z učitelji, anketiranje učiteljev in anketiranje učencev. Pet opazovalcev je izvedlo trideset opazovanj pouka naravoslovja v 7. razredu na izbranih šolah. V tretjini primerov je opazovanje pouka naravoslovja trajalo dve šolski uri (blok ura). Anketni vprašalnik za učitelje naravoslovja je izpolnilo 39 učiteljev; poleg 30 učiteljev vključenih v opazovanje pouka, še 9 dodatnih učiteljev naravoslovja, ki poučujejo na šolah v spremljavi. Anketni vprašalnik o pouku naravoslovja je izpolnilo 177 učencev.

REZULTATI

Iz povprečnih ocen, dobljenih na osnovi izpolnjenih instrumentarijev ob opazovanju pouka, ki se gibljejo v razponu 3,8 – 4,4 (na lestvici 1-5), lahko sklepamo: da poteka pouk naravoslovja v spodbudnem delovnem vzdušju, da je pri pouku naravoslovja ustrezen poudarek na aktivnostih učencev in na raznolikih učnih oblikah, da imajo učenci dovolj priložnostih za izražanje mnenja in predstavitve svojega dela ter da dobijo ustrezne povratne informacije o svojem delu. Po oceni opazovalcev pouka je pouk v glavnem potekal v primerno opremljeni učilnica in ob ustrezni uporabi učnih pripomočkov. Slabše so opazovalci v povprečju ocenili spodbujanje učencev h kritičnemu razmišljanju (povprečna ocena 3). Pri opazovanih urah je bilo malo povezovanja pridobljenega znanja z vsebinami drugih predmetov (povprečna ocena pod 3), z najslabšo povprečno oceno pa je bila ocenjena diferenciacija in individualizacija dejavnosti in nalog.

V okviru opazovanja pouka naravoslovja je bil poseben poudarek namenjen zasnovi in izvedbi praktičnega oziroma eksperimentalnega dela pri pouku naravoslovja. Pri 40 % opazovanj, kjer je pouk vključeval praktično delo učencev, so opazovalci pouka ocenili ustreznost zasnove eksperimentalnih dejavnosti (ustrezen izbor dejavnosti/poskusa in primerno zasnovan delovni list…) s povprečno oceno 3,8, nekoliko slabše pa je bila ocenjena izvedba praktičnega oz. eksperimentalnega dela (povprečna ocean 3,2 na lestvici 1-5). Pri petih opazovanjih so opazovalci posebej poudarili, da je bila izvedba praktičnega dela preveč vodena in da je oblikovanje zaključkov opravil kar učitelj sam.

Iz rezultatov izpolnjenih anketnih vprašalnikov učencev lahko sklepamo (povprečne ocene v razponu 4,0 – 4,6 na lestvici 1 - 5), da se zdi učencem pouk naravoslovja zanimiv, razumljiv, koristen, da imajo naravoslovje radi in se pri pouku naravoslovja dobro počutijo. Poznajo kriterije ocenjevanja in menijo, da je njihovo znanje naravoslovja dobro. Pri pouku naravoslovja pogosto eksperimentirajo.

Nekoliko slabše (povprečne ocene v razponu 3 – 4) učenci ocenjujejo uporabo drugih virov (razen učbenika) pri pouku naravoslovja ter možnosti uporabe pridobljenega naravoslovnega znanja pri drugih predmetih. Najmanj (povprečna ocean 1,7 na lestvici 1 - 5) so se učenci strinjali s trditvijo, da dobijo večkrat drugačne naloge za reševanje kot ostali sošolci (diferenciacija). Pri domačih nalogah učenci ne potrebujejo veliko pomoči. 44 % učencev porabi tedensko doma za učenje in domače naloge iz naravoslovja manj kot eno uro, 39% učencev pa eno do dve uri časa.

Iz visokih povprečnih vrednosti stopnje strinjanja s posameznimi trditvami v anketnem vprašalniku za učitelje (razpon med 4,2 in 4,6 na lestvici 1-5) je razvidna ocena učiteljev, da pri pouku naravoslovja v veliki meri spodbujajo učence k samostojnemu delu, razvijanju kritičnega razmišljanja in da sistematično spremljajo delo in napredek učencev. Pri pouku naravoslovja učenci pogosto rešujejo praktične vaje in naloge. Učitelji uporabljajo ob učbeniku tudi druge vire (revije, slovarje, IKT).

Učitelji so v anketi podali povprečno oceno strinjanja med 3,5 in 4,0 z naslednjimi trditvami: da učenci pri pouku naravoslovja uporabljajo IKT, da učitelji redno izvajajo konzultacije z učenci in da je pouk naravoslovja v precejšnji meri individualiziran in diferenciran.

Iz anketnih vprašalnikov učiteljev lahko povzamemo, da se učitelji naravoslovja v veliki meri (povprečje 4,2 in več na lestvici 1 - 5) stalno strokovno izpopolnjujejo, sodelujejo v strokovnih aktivih na šoli in pri razvojnem delu šole. Na razpolago imajo dovolj strokovnega gradiva in vso potrebno podporo vodstva šole. Učitelji ocenjujejo (povprečje 4 na lestvici 1 - 5), da veljavni učni načrt predstavlja ustrezno podlago za kakovosten pouk naravoslovja, vendar je kakovostna in nemotena izvedba možna le v manjših oddelkih.

ZAKLJUČEK

Učitelji naravoslovja so zadovoljni z učnim načrtom za naravoslovje v 7. razredu in ne navajajo posebnih težav pri realizaciji ciljev predmeta naravoslovje v 7. razredu. Največ ovir, ki se odražajo na kakovosti pouka naravoslovja, pripisujejo slabim materialnim pogojem, neustrezni opremljenosti učilnice in neustrezno urejenemu laborantstvu.

Rezultati kažejo, da je pri pouku naravoslovja v osnovni šoli precejšen poudarek na aktivnostih učencev, zlasti na praktičnem (eksperimentalnem) delu. S tem tudi povezujemo pozitiven odnos učencev do predmeta. Čeprav so učitelji v anketi dobro ocenili svoja prizadevanja za diferenciran in individualiziran pristop pri pouku naravoslovja, pa vsi ostali rezultati (intervjuji, opazovanje pouka, ankete učencev) kažejo na to, da je prav to področje najbolj zapostavljeno.

Opazovanja pouka in intervjuji z učitelji so pokazali, da je eksperimentalno delo (praktični pouk) pogosto preveč vodeno izpeljano, da je le redko problemsko zasnovano in da bi učenci pri tovrstnih dejavnostih lahko imeli več priložnosti za raziskovanje in razvijanje višjih miselnih procesov.

Glede na priporočila in sodobne trende pri poučevanju naravoslovja bi se v bodoče veljalo usmeriti v vpeljevanje takšnih didaktičnih pristopov, da bi se v večji meri učenci učili naravoslovja z odkrivanjem in raziskovanjem ter imeli ob tem priložnosti za spoznavanje metodologije raziskovalnega dela in urjenje miselnih procesov in navad.

ABSTRACT

The goal of this study was to explore whether the use of multimedia in genetics instruction contributes more than other instructional modes to students' knowledge and comprehension. Four comparable groups of high school students were taught the process of protein synthesis: group 1 was taught only by reading text, group 2 by text supplemented with illustrations, group 3 in the traditional lecture format and group 4 through multimedia that integrated two short computer animations. Our findings lead to the conclusion that better learning outcomes can be obtained by the use of animations or at least illustrations when learning genetics.

Keywords: *multimedia learning, acquired knowledge, improvement of comprehension, retention of knowledge and comprehension.*

UVOD

Genetika je zelo povezana z vsakdanjim življenjem. Zato je pomembno, da dijaki znanja, ki jih pridobijo tekom učenja razumejo. Po besedah mnogih učencev pa je genetika, kljub temu, da je zelo zanimiva, tudi zelo zahtevna za učenje. S tem se strinja tudi veliko učiteljev, ki opažajo padec motivacije in slabo znanje učencev, ko pri pouku obravnavajo poglavja iz genetike. Učitelji nemalokrat priznajo, da imajo že s samim načinom poučevanja genetike težave. Zato smo v naši raziskavi testirali vpliv različnih načinov poučevanja sinteze beljakovin na znanje in razumevanje dijakov.

METODA

VZOREC

V raziskavi je bilo vključenih 468 dijakov 3. in 4. letnika dveh srednjih strokovnih šol in dveh gimnazij v Ljubljani. V vzorcu je bilo zajetih 193 moških (41.2 %) in 275 žensk (58.8%).

PRIPOMOČKI

Sestavili smo predtest znanja (ocena predznanja s področja zgradbe nukleinskih kislin in podvajanja DNK) in test znanja. Pripravili smo tudi učno enoto na temo sinteze beljakovin za štiri eksperimentalne skupine: za skupino dijakov, ki so se učili le z besedilom, za skupino dijakov, ki so se učili z besedilom in ustreznimi slikami, za učitelje, ki so poučevali dijake tekom klasične ure in za skupino dijakov, ki so se učili s pomočjo multimedije.

POTEK

Raziskava (izpeljana v šolskem letu 2007/2008) je obsegala štiri eksperimentalne ure v vsakem izbranem razredu. V prvi uri smo dijake seznanili z namenom in potekom raziskave ter rešili so predtest. Čez en teden so se dijaki najprej eno uro učili sinteze beljakovin v določenih pogojih (z besedilom, z besedilom in slikami, tekom klasične učne ure ali z multimedijo), zatem pa v drugi uri reševali test znanja (test 1). Četrta ura je bila izvedena po petih tednih, ko smo preverjali trajnost pridobljenega znanja in razumevanja sinteze beljakovin, dijaki so ponovno pisali test znanja (test 2).

ANALIZA PODATKOV

Podatke smo analizirali s pomočjo SPSS programa. Za analizo predtesta smo uporabili enosmerno analizo variance. Ker je analiza pokazala različnost predznanja dijakov posameznih ekaperimentalnih skupin, smo pri nadaljnji statistični obdelavi podatkov uporabili analizo kovariance (ANCOVA) in Bonferronijev Post Hoc test. Pri splošni primerjavi rezultatov testa 1 in testa 2 med eksperimentalnimi skupinami smo uporabili Repeated Measures ANCOVA. Primerjavo rezultatov test 1 in test 2 znotraj posamezne eksperimentalne skupine smo izvedli s T-testom.

REZULTATI

Najvišji uspeh na celotnem testu 1 so dosegli dijaki, ki so se učili z multimedijo in tisti, ki so se učili z besedilom in slikami, nižji uspeh so dosegli dijaki, ki so se učili tekom klasične ure in najnižji tisti, ki so se učili le z besedilom. Enake rezultate smo dobili pri analizi pridobljenega znanja. V primeru pridobljenega razumevanja pa se rezultati razlikujejo le v tem, da med dijaki, ki so se učili z multimedijo in tistimi, ki so se učili tekom klasične učne ure ni statistično pomembnih razlik. Vse ostale razlike so enake kot v primeru uspeha na celotnem testu 1 in v pridobljenem znanju.V primeru analize uspeha na testu 2 so statistično gledano najvišji uspeh dosegli dijaki, ki so se učili z multimedijo, nižji, dijaki, ki so se učili z besedilom in slikami in najnižji, dijaki, ki so se učili tekom klasične ure in dijaki, ki so se učili le z besedilom. V primeru analize trajnosti znanja so statistično gledano največ znanja na testu 2 pokazali dijaki, ki so se učili z multimedijo, nižje, dijaki, ki so se učili z besedilom in slikami ter dijaki, ki so se učili tekom klasične učne ure, najnižje znanje na testu 2 so pokazali dijaki, ki so se učili le z besedilom. V primeru analize trajnosti razumevanja so statistično gledano najvišje razumevanje na testu 2 pokazali dijaki, ki so se učili z multimedijo, in sicer v primerjavi z vsemi ostalimi dijaki, med katerimi pa ni statistično pomembnih razlik. Primerjava uspeha doseženega na testu 1 in testu 2 znotraj posameznih eksperimentalnih skupin je pokazala statistično pomemben upad uspeha, znanja in razumevanja, in sicer znotraj vseh eksperimentalnih skupin, razen znotraj skupine, ki se je učila le z besedilom. Tem dijakom so namreč njihove učiteljice biologije v času 5.-ih tednov do ponovnega merjenja uspeha še enkrat razložile celotno snov. Od tod porast uspeha na testu 2 v primerjavi s testom 1. Kljub temu pa je uspeh teh dijakov ostal med najnižjimi. Podrobnejša analiza z Bonferronijevm Pos Hoc testom je pokazala statistično pomembnost razlik le med nekaterimi eksperimentalnimi skupinami (Tabela 1).

Tabela 1: Rezultati Bonferronijevega Post Hoc testa primerjave eksperimentalnih skupin v rezultatih doseženih na celotnem testu 1 in testu 2, v znanju, razumevanju in njuni trajnosti

	Skupina[a]	MD (SE) p		Skupina[a]	MD (SE) p

MD, povprečje razlik; SE, standardna napaka; p, statistična pomembnost razlik: *** p<0.001, ** p<0.01, * p<0.05.

[a]Oznake eksperimentalnih skupin: B, besedilo; BS, besedilo s slikami, K, klasična ura; M, multimedija.

ZAKLJUČEK

Iz raziskave lahko sklenemo, da je uporaba multimedije ali vsaj slik ob besedilu pomembna pri učenju sinteze beljakovin, saj pripomore k večji pridobitvi znanja in razumevanja pa tudi njunemu ohranjanju.

LEARNING ABOUT THE CHARACTERISTICS OF HALOGENS
/
SPOZNAVANJE LASTNOSTI HALOGENOV

Marinka Šipec

VIZ OŠ Bistrica ob Sotli

marinka.slogar@guest.arnes.si

ABSTRACT

In the article the essential benefits of using an interactive board as a tool for better teaching of chemistry in the primary school is provided. Emphasis is placed on the use of boards as a completely safe chemical laboratory. Dealing with new educational material on the halogen elements in the 8th class is presented.

Keywords: *the use of an interactive board, teaching chemistry in the primary school, halogen elements.*

UVOD

Interaktivna tabla je orodje, ki omogoča raziskovanje po medmrežju, dostop do datotek in programov na računalniku ter pisanje s svetlobnim črnilom. Njena prednost je zapomnitev vsega, kar je bilo na njej prikazanega, možnost prenosa le-tega na računalnik in uporaba pri naslednjih urah.

Najpomembnejše pri poučevanju kemije v OŠ je, da lahko tablo uporabimo kot popolnoma varen kemijski laboratorij, ki vsebuje veliko več opreme in kemikalij kot naši običajni laboratoriji. V njem lahko počnemo poskuse s kemikalijami, ki so ali preveč reaktivne ali preveč strupene, da bi jih lahko uporabljali v razredu. Pri teh poskusih ni strahu, da nam ne bi uspeli npr. zaradi prestare kemikalije. Seveda pa je prisotna tudi slabost, ki pa je včasih prednost, da ne moremo zaznati vonjav. Prednost je tudi, da ne nastajajo odpadne kemikalije in da nam po poskusih ne ostane kup umazane steklovine.

Poskus pripravimo enkrat, ga shranimo in ga nato lahko uporabimo za ponavljanje ter utrjevanje pri naslednjih urah, v več razredih in na voljo nam je več let.

Ti poskusi pa ne morejo in ne smejo zamenjati tistih, ki jih učitelji in učenci izvajamo s kemikalijami, ampak jih lahko nadgradijo. Poskuse najprej izvedemo v živo, nato pa prikažemo še enakega s programom za interaktivno tablo. Te poskuse lahko nadgradimo z natančnejšimi meritvami, izrisi grafa, prikazom enačb kemijskih reakcij v različnih oblikah ali s prikazom dogajanja na nivoju delcev.

METODA IN REZULTATI

Vsi halogeni elementi so strupeni. Fluor in klor sta pri sobni temperaturi zelo nevarna plina in pri vdihavanju poškodujeta dihalne poti. Klor in druge klorove spojine so v 1. svetovni vojni uporabljali kot bojni strup. Brom močno poškoduje kožo in rane se težko celijo. Jod je med halogenimi elementi najmanj strupen, zato jih z izjemo joda v šolskem kemijskem laboratoriju nimam.

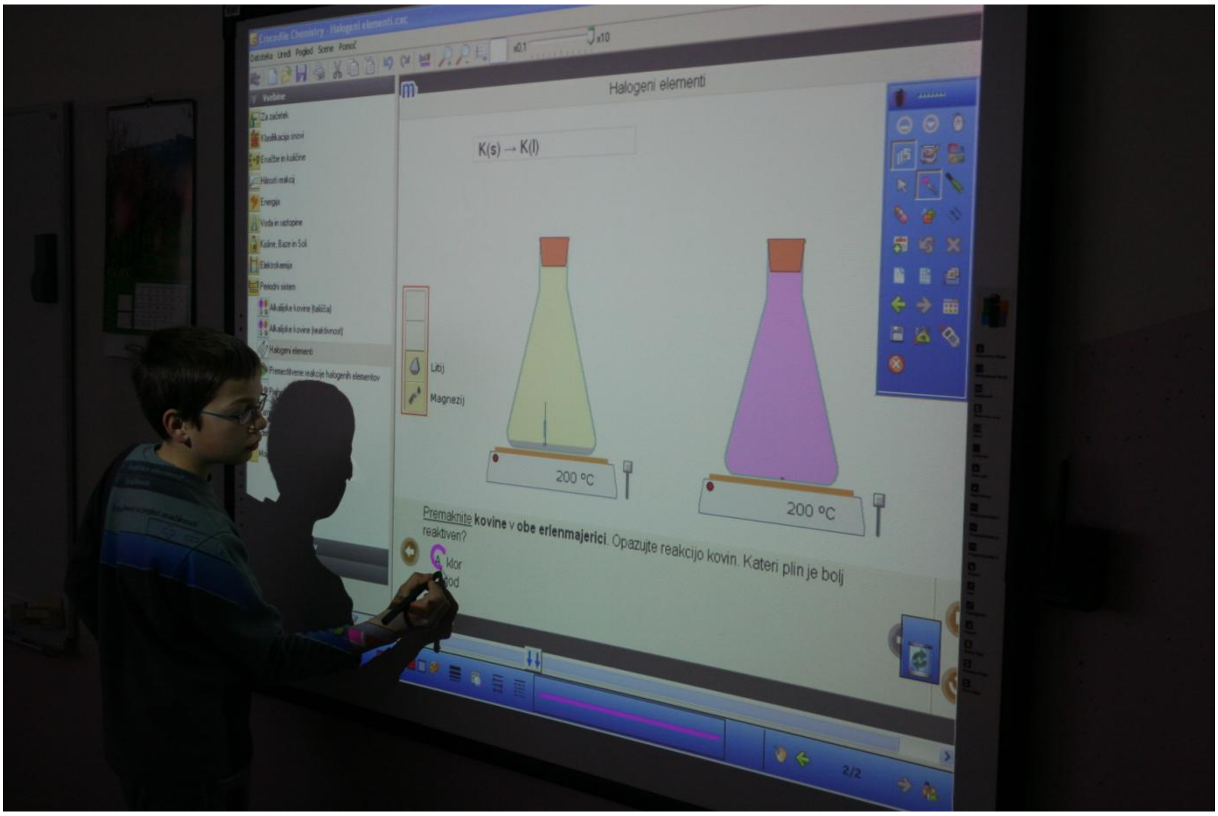
Zaradi prej navedenih vzrokov sem se odločila, da podam novo učno snov o halogenih elementih s pomočjo interaktivne table. Za pripravo te ure sem uporabila:

1. internetno stran http://www.osbos.si/e-kemija/e-gradivo/6-sklop/uporaba_halogenov.html,

2. aplikacijo programa crocodile chemistry periodni system:

   - halogeni elementi, ki prikazujejo reakcije kalija, natrija, litija in magnezija s klorom in jodom,
   - premestitvene reakcije halogenih elementov, ki prikazujejo reakcije spojin halogenih elementov

3. internetno stran http://www.osbos.si/e-kemija/e-gradivo/6-sklop/utrjevanje3.htm.



Slika 1: Uporaba interaktivne table

ZAKLJUČEK

Uporaba elektronske table mi je omogočila, da je bila učna ura zanimivejša, nazornejša in kvalitetnejša. Vsi učenci so mnenja, da se je pouk razlikoval od običajnega. Učenci si še želijo takega pouka, ker se jim zdi sodobnejši. Vendar so tudi pripomnili, da rajši gledajo poskuse v živo.

CROSS-CURRICULAR CONNECTIONS IN SCIENCE: DESIRED GOAL OR REDUNDANT CATEGORY IN SYLLABI
/
MEDPREDMETNO POVEZOVANJE V NARAVOSLOVJU: ZAŽELEN CILJ ALI ODVEČNA RUBRIKA V UČNIH NAČRTIH

Andrej Šorgo

Univerza v Mariboru, Fakulteta za naravoslovje in matematiko

andrej.sorgo@uni-mb.si

ABSTRACT

Cross-curricular connections were one of the mayor goals of the 1998 school reform. Later, it was recognized that connections between subjects were vital mainly as a part of extracurricular activities and project work, but not in regular teaching in the classroom. On the basis of recognized problems, leading principles were prepared as a baseline for new syllabi in the year 2007. These leading principles are: teacher and school autonomy, approach of teaching-aiming and process-development, openness and selectivity (flexibility of the teaching process), competitive approach, quality of knowledge (immediacy, permanence and applicability of knowledge) and global approach of learning and teaching and encouraging curricular connections. But even if the intentions of the authors of curricular documents are clearly written, cross-curricular connections are one of the weakest points in Slovenian school system. The reasons are many: lack of strong autonomy, strictly subject-set syllabi, lack of such themes in textbooks and learning materials, and final examinations do not require cross- curricular integration. The contribution presents the possibility of interdisciplinary integration of science subjects based on the development of generic competences by using ICT.

Keywords: *Science, cross curricular connections, competences, information and communication technology*

UVOD

Pomembnejši cilj kurikularne prenove ob koncu prejšnjega stoletja je bilo medpredmetno povezovanje znanj ter pouk, ki bi se odlepil zgolj od akademskih vsebin. Nekaj let kasneje pa smo lahko ugotovili, da je bil ta cilj prenove uresničen v mnogo manjši meri, kot bi to bilo zaželeno (Rutar – Ilc, 2005, Šorgo in Šteblaj, 2007). Tako je bilo znanje, ki so ga učenci in dijaki pridobili še vedno vse preveč razdrobljeno in nepovezano, očitati pa mu je bilo mogoče tudi nizko stopnjo, s frontalnim delom, kot prevladujočo obliko in metodo dela, čeprav bi si dijaki pri pouku želeli predvsem aktivno delo ter čimveč laboratorijskehga in terenskega dela.

Približno deset let kasneje je bila sprožena prenova in posodobitev učnih načrtov. Načrtovana prenova gimnazijskega programa, ki je predvidevala tudi prerazporejanje ur pouka, pa je bila zaradi burnega odziva javnosti ustavljena. V prenovo se je krenilo na osnovi ključnih prepoznanih problemov zapisanih v dokumentu: »Smernice, načela in cilji posodabljanja učnih načrtov«, ki ga je pripravila Komisija za spremljanje in posodabljanje učnih načrtov in katalogov znanj za področje splošnega izobraževanja in splošno-izobraževalnih znanj v poklicnem izobraževanju (2007). Komisija je izoblikovala temeljna načela, na katerih naj bi temeljila prenova. Ta načela so bila:

- avtonomija učtelja in šole;
- jasna vodilna ideja predmeta;
- učno-ciljni in procesno-razvojni model pouka;
- odprtost in izbirnost (fleksibilnost učnega procesa);
- kompetenčnost;
- kakovost znanja;
- razvojno spremljanje učenčevih dosežkov in razvoj metakognitivnih sposobnosti;
- povezovanje predmetov in disciplin - globalni pristop, ki spodbuja »celostno« učenje in poučevanje.

Na osnovi teh smernic je bila nato sprožena posodobitev učnih načrtov, čeprav so posamezne predmetne skupine v resnici izvedle prenovo (Kalin, 2008). Delo po prenovljenih učnih načrtih, čeprav so bili pripravljeni za celo splošno-izobraževalno šolsko vertikalo, pa je steklo le v gimnazijskem programu, medtem ko je bilo uvajanje, zaradi ne povsem prepričljivih razlogov, v osnovne šole ustavljeno.

MEDPREDMETNO POVEZOVANJE V PRAKSI

Medpredmetno povezovanja po šolah poteka praviloma v obliki povezovanja povezovanje v okviru različnih dejavnosti, kot so projektni dnevi, naravoslovni tabori, ekskurzije, izbirne vsebine ipd., medtem ko je povezovanja, ki bi posegalo na nivo »vsakodnevnega« poučevanja, neprimerno manj. Zora Rutar Ilc (2005, str. 60) je na osnovi opazovanj pouka, ki so ga opravili svetovalci Zavoda RS za šolstvo ob spremljavi gimnazij, zapisala: *»Tudi na elemente medpredmetnega sodelovanja smo naleteli bolj po naključju; učitelji so v intervjujih povedali, da jim načrtno ponavadi ne posvečajo pozornosti in da se jim bolj »zgodijo«. Pojmovanja medpredmetnosti, ki so bila izpostavljena v intervjujih, tudi niso presegala idej o rutinskih korelacijah. Idej o medpredmetnih ali transdisciplinarnih projektih ni bilo.«*

Med pomembnejšimi vzroki za takšno stanje so: omejena krepka avtonomija učiteljev; ozko predmetno zastavljeni učni načrti; v učbenikih in gradivih skoraj ni medpredmetno obravnavanih tem; znanje, ki se preverja ob zaključku šolanja ne zahteva medpredmetnega povezovanja.

Šorgo in Šteblaj (2007) sta še v času priprav novih učnih načrtov zapisala: *"Medpredmetnega sodelovanja, kot zaželenega cilja kurikularne prenove, ni bilo mogoče doseči le s prenosom odgovornosti zanj na učitelje po šolah. Zato predlagamo, da se pri prenovi gimnazijskega programa težišče medpredmetnega sodelovanja z organizacijskega prenese na vsebinski in didaktični nivo, kjer pa ključno vlogo igrajo učni načrti. Učne načrte je potrebno že v fazi nastajanja uskladiti na način, ki bo omogočil fleksibilnost in avtonomijo učiteljem na posamezni šoli. S tem bi na institucionalni ravni omogočili medpredmetno povezovanje in aktiviranje učiteljeve in dijakove kreativnosti.*" Ob analizi prenovljenih učnih načrtov lahko ugotovimo, da nasvet kasneje ni bil upoštevan.

Načeloma je z malo domišljije in nekaj akrobacijami v razmišljanju možno poiskati in tudi najti povezave med dvema ali več poljubnimi vsebinami katerihkoli predmetov, čeprav se lahko zdijo neodvisnemu opazovalcu takšne povezave prisiljene. Je pa povsem nerazumljivo, da ostajajo nepovezani »naravni« sklopi predmetov, kot so fizika, kemija in biologija, saj so v bistvu le trije nivoji razlage dogajanj v naravi.

Za medpredmetno povezovanje sta ustrezna predvsem dva načina. V prvem primeru izberemo ustrezno vsebino, ki jo nato proučujemo iz različnih zornih kotov. V drugem primeru pa izberemo skupno metodo, ki jo nato uporabimo pri obravnavi različnih vsebin. V vsakodnevni praksi je največ težav s povezovanjem vsebin, ki se sicer obravnavajo pri različnih predmetih, a v različnih časovnih obdobjih in iz različnih aspektov (npr. ekološke vsebine). Iluzija je pričakovati, da bi lahko vse vsebine, ki jih je moč medpredmetno povezati, časovno tudi povsem uskladili, saj ima vsak predmet, kakor tudi zaokroženo poglavje znotraj predmeta, svojo notranjo logiko, ki je ni mogoče povsem prezreti. Praktiki po šolah praviloma razrešujejo ta problem na način, da izbrano vsebino po medsebojnem dogovoru sodelujočih učiteljev izvedejo izven ur rednega pouka po urniku, najpogosteje v sklopu izbirnih vsebin. Žal na ta način ostane večina vsebin med predmeti nepovezana, iskanje povezav pa prepuščeno posameznim učiteljem ali celo dijakom.

Za povezovanje vsebin v sklopu rednega pouka bi lahko bil ustreznejši drugi pristop, kjer bi snov sicer obravnavali pri različnih predmetih v različnem časovnem obdobju, »lepilo« pa bi predstavljale uporabljene metode in poudarki, ki bi napeljevali k medpredmetnemu povezovanju in transferu znanj med različnimi predmeti. Prednost metode, kot povezovalnega elementa med predmeti je, da metoda ni vezana na časovne okvire, zato jo je mogoče uporabiti neodvisno od časovne umeščenosti vsebine v učni načrt posameznega predmeta. Ena od možnih stičnih točk med predmeti, ki bi lahko povečale transfer znanj med njimi, je računalniško podprt laboratorij, kar se je izkazalo tudi že v praksi. S pomočjo enake metode dela je bilo mogoče preseči prepad ne le med predmeti, temveč celo med različnimi tipi šol.

GENERIČNE KOMPETENCE: LEPILO MEDPREDMETNEGA POVEZOVANJA

V zadnjih letih so pozornost strokovne javnosti pritegnile kompetence, opredeljene v evropskem referenčnega okvira (Uradni list Evropske unije L 394/13), kot kombinacija znanja, spretnosti in odnosov, ustrezajočih okoliščinam. Medtem, ko so ključne kompetence preveč splošne, da bi jih bilo mogoče uporabiti za operacionalizacijo medpredmetnega povezovanja, pa temu ni tako z generičnimi (transverzalnimi) kompetencami, saj so predmetno neodvisne.V projektu »Razvoj naravoslovnih kompetenc« smo na osnovi Meyerjevega poročila zasnovali naslednjo listo generičnih kompetenc, ki jih posameznik bolj kot s specifičnim učenjem določene snovi razvija z načinom dela. Kompetence na katerih smo zasnovali delo v projektu so:

- sposobnost zbiranja informacij,
- sposobnost analize in organizacija informacij,
- sposobnost interpretacije,
- sposobnost sinteze zaključkov,
- sposobnost učenja in reševanja problemov,
- prenos teorije v prakso,
- uporaba matematičnih idej in tehnik,
- prilagajanje novim situacijam,

- skrb za kakovost,
- sposobnost samostojnega in timskega dela,
- organiziranje in načrtovanje dela,
- verbalna in pisna komunikacija,
- medosebna interakcija ter
- varnost pri delu.

Ob preverjanju gradiv, zasnovanih na kompetenčnem pristopu, se je izkazalo, da so bile še posebej učinkovite so bile povezave, ki so vključevale še uporabo informacijske in komunikacijske tehnologije.

Predmetno-specifične kompetence – so kompetence, specifične za vsako posamezno strokovno-znanstveno področje, npr. za kemijo, matematiko, fiziko, biologijo, itn. ter za medpredmetno povezovanje manj primerne.

SKLEP

Ob branju prenovljenih učnih načrtov lahko ponovno ugotovimo, da so prav ti en od temeljnih vzrokov za pomanjkljive medpredmetne povezave. Na njihovi osnovi so namreč napisani učbeniki, maturitetni katalogi ter iz njih izhajajoča nacionalna preverjanja znanja in matura. In kar se ne preverja in ocenjuje, je v šolah žal obsojeno na životarjenje. Upanje nam pa dajejo posamezni učitelji, ki so sposobni preseči prepade med predmeti v dobro svojih učencev in dijakov.

ZAHVALA

Delo je bilo izvedeno na Fakulteti za naravoslovje in matematiko Univerze v Mariboru kot del projekta Razvoj naravoslovnih kompetenc. Projekt sofinancirata Ministrstvo za šolstvo in šport Republike Slovenije ter Evropski socialni sklad.

THE WATER CYCLE
/
KROŽENJE VODE

Asja Štucin

OŠ Tržič

asja.stucin@gmail.com

ABSTRACT

What circulates and what changes is one of the thematic components at a school subject Science and technology in 5th class. Basic standards require knowledge and understanding of the circulation of water in nature and the importance of rotation for balance in nature. The preferred method to attain these teaching aims seemed a role play to me. I proposed to play a game of the circulation of water to my students. The play lasted for about 15 minutes then the questions for consolidating learning materials followed. Such method covers all learning processes: verification of previous knowledge, reading new teaching materials and consolidating knowledge. Science contents (water circulation) were articulated with engineering (construction costumes).

Keywords: *water cycle, role play, costumes, concrete learning methods*

UVOD

V šolskem letu 2008/09 sem poučevala predmet naravoslovje in tehnika v 5. razredu na Podružnični šoli v Lomu pod Storžičem. V oddelku je bilo samo 10 učencev in učenk. Eden izmed vsebinskih sklopov tega predmeta je tudi Kaj kroži in kaj se spreminja. Temeljni standardi, ki jih morajo učenci doseči zahtevajo poznavanje in razumevanje kroženja vode v naravi in pomen kroženja za ravnotežje v naravi. Operativni cilji so bolj konkretni. Razumeti morajo procese pri kroženju vode: spreminjanje temperatur, agregatnega stanja in gibanje; razumeti stekanje tekoče vode proti morju, ki je največji zbiralnik vode; razlikovati med površinskimi vodami in podtalnicami ter spoznati pomen podtalnice kot vira pitne vode. Veliko zahtevnih in dokaj nepredstavljivih ciljev za učence v petem razredu, ki so stari okrog 10 let.

METODA

Razmišljala sem, s katerimi učnimi metodami in oblikami bi jim to učno snov najlažje predstavila. Igra vlog se mi je zdela najprimernejša. Učencem sem predlagala, da bi zaigrali igrico o kroženju vode. Želela sem, da sami napišejo scenarij, sami izdelajo kustume in si izberejo glasbeno ozadje. Z navdušenjem smo se lotili dela. Ena izmed učenk je odlično napisala besedilo, vloge sem podelila prav vsem učencem, kustume pa smo izdelali kar v šoli. Iz debele pene smo izrezali 5 velikih kapljic, jih pobarvali z modro barvo in nanje namestili elastike. Podobno smo naredili dva oblaka, le pobarvali smo ju s sivo barvo. Sonce smo ravno tako izrezali iz pene in ga pobarvali rumeno. Učenka si ga je namestila na glavo. Dve dekleti, ki sta igrali rožici pa sta se oblekli v zelena oblačila na glavo pa sta si nadeli klobuk v obliki cvetnih listov. Tudi glasbo smo izbrali skupaj, upoštevala sem njihove predloge, saj sem želela, da se med igranjem počutijo sproščeno. Igrica je bila dolga okrog

15 minut, potem pa so sledila vprašanja za utrjevanje učne snovi o kroženju vode. Vsi so morali poznati svojo vlogo in vloge drugih učencev in znati razložiti pomen vseh likov v igrici.

REZULTATI

Učno uro Kroženje vode so učenci POŠ Lom pod Storžičem predstavili študentom Pedagoške fakultete iz Maribora in učencem 5. razreda OŠ Tržič. Na ta način smo prikazali enega izmed možnih pristopov do razumevanja načrtovanih učnih vsebin. Študentje so pokazali velik interes in bili presenečeni nad samostojnostjo in originalnostjo učencev.

ZAKLJUČEK

Menim, da je bila tovrstna metoda za obravnavo omenjene učne snovi odlično izbrana, saj je zajela vse učne procese: od preverjanja predznanja, obravnave nove učne snovi in utrjevanja znanja. Hkrati so bile tudi učne oblike med seboj prepletene; od skupinske (timsko delo), sodelovanja dvojic (rožici, oblaka) in navsezadnje tudi individualne učne oblike. Prepletla sem naravoslovne vsebine (kroženje vode) s tehniškimi (izdelava kustumov). Pomnjenje pojmov iz vsebinskega sklopa o kroženju vode v naravi bo pri večini učencev zaradi konkretizacije dogajanja najbrž trajnejše kot bi bilo sicer.

PROJECT OF PROTECTING THE FROGS IN PODLJUBELJ / PROJEKT ZAŠČITE ŽAB V PODLJUBELJU (PRIMER POVEZOVANJA ŠOLE IN KRAJANOV ZA ZAŠČITO OGROŽENE ŽIVALSKE VRSTE)

Romana Turk

OŠ Tržič

romana.turk@guest.arnes.si

ABSTRACT

In spring 2006 the students gave notice on how the road through the village Deševno is literally covered with run-over frog corps. With the help of the local community we have acquired all the necessary location information and the students along with the teachers considered all the technical details about setting up a security fence. The first setting up of a fence was performed in March 2008. We ascertain that our project contributed considerably to preservation of our natural heritage, since we managed to save 86 frogs in a single rainy spring night.

Keywords: *frogs, migration, security fence, community*

UVOD

Šola mora biti povezana z življenjem. Odraža naj značilnosti ljudi in kraja, kjer živijo njeni učenci. Zato je prav, da sprejemamo njihove želje, pobude in opažanja. Redko pa se rešitve, ki jih predlagamo v šoli, uresničijo.

Opisan projekt zaščite dvoživk ob bajerju Jezerc v Podljubelju je primer dobre povezave šole, krajanov in širše lokalne skupnosti. Premagali smo finančne, administrativne in tehnične ovire, tako da projekt še živi. Zaščitno ograjo tako postavljamo že tretje leto zapored.

METODA

Tabela 1: Cilji, metode dela

Cilji:	Metode, oblike dela:
Učenke in učence - vzgajati v duhu pozitivnega odnosa do narave, - uriti v tehnikah opazovanja, načrtovanja, - razvijati njihove ročne spretnosti, - učiti jih sodelovalnega učenja, - učiti jih osnovnih bioloških zakonitosti, - razvijati čut za prostovoljno delo.	- terensko delo, - eksperimentalno delo, - praktično delo, - metoda risanja, beleženja podatkov - raziskovalno delo

Cilje smo uresničili na naravoslovnem dnevu, interesnih dejavnostih, na delovnih akcijah v prostem času, na ekodnevu.

REZULTATI

Ugotavljanje pomanjkljivosti v okolju, opozarjanje na okoljske probleme je brez pomena, če ne vodi do konkretnih rešitev. Projekt zaščite dvoživk v Podljubelju je primer povezovanja teoretičnih vsebin s prakso, primer povezovanja šole in lokalne skupnosti. Poleg strokovnega znanja s področij biologije, tehnike, varstva okolja, ki so ga učenci in sodelavci pridobili pri dejavnostih projekta, ima posebno vrednost zaradi preseganja pogostih predsodkov o žabah.

Povezali smo se s strokovnjaki Biotehniške fakultete iz Ljubljane, Centrom za kartografijo favne in flore, člani Lions kluba in županom naše občine.

Vsi sodelujoči smo opazovali, delali, popisovali, reševali, prepričevali in nenazadnje tudi moledovali za to, da lahko zaščitno ograjo postavljamo že več let zapored. Pri tem pa nam pomagajo tudi občina in krajevna skupnost ter lastnik zemljišča.

ZAKLJUČEK

Projekt zaščite žab v Podljubelju je zelo zahteven, saj je potrebno sodelovanje širše skupnosti. Že na začetku smo ga zasnovali tako, da nadaljujemo z delom tudi v naslednjih letih. Učenke, učenci in učitelji smo že »pravi mojstri« za postavljanje ograje, saj jo del vsako pomlad in jesen podremo in potem ponovno namestimo. Teren ob bajerju Jezerc je postal vzorčni primer za zaščito žab pred selitvami čez prometne ceste. Pogosto ga obiskujemo z učenci naše šole. Tam izvajamo naravoslovne, tehniške dneve. Skratka, ugotavljamo, da je postal naša učilnica na prostem, kjer v naravi lahko opazujemo življenjsko pestrost. Za krajane pa je prostor oddiha in sprostitve.

Slika 1: Zaščitna ograja

ENCOURAGING YOUTH FOR NATURAL SCIENCES AND TECHNICS
/
SPODBUJANJE MLADIH ZA NARAVOSLOVJE IN TEHNIKO

Karmen Vidmar

Gimnazija Jurija Vege Idrija

karmen.vidmar@guest.arnes.si

ABSTRACT

In Idrija there companies that are in the lead in their branches. Their development demands more educated employees of electronics and mechanical engineering. Secondary school GJV Idrija is the only such school in the region and has a crucial role in directing students into deficient jobs. Visits to companies, showing students chances of employment and introducing students to the work in laboratories are activities that were carried out in the project Encouraging youth for natural sciences and technics. During the visits students did one of the obligatory laboratory exercises in physics in laboratories of the companies Kolektor and Hidria.

Keywords: *Laboratory exercises, technical occupations, company, natural sciences and technics*

UVOD

Idrija je bila stoletja rudarsko mesto, ki je tradicijo rudarjenja prenašalo iz roda v rod. Ob zatonu rudnika živega srebra se je v mestu in njegovi okolici začela razvijati strojna- in elektroindustrija, ki je počasi, toda vztrajno začela preraščati okvire dodatnega delodajalca nizkokvalificirane delovne sile. Danes sta Kolektor in Hidria podjetji, ki igrata na svetovnem trgu pomembno vlogo v svojih panogah; podvrženi sta močni konkurenci in vedno novim izzivom. Da lahko ostaneta ključna igralca na tem trgu, pa je pomemben priliv visoko strokovnega kadra, ki ga med drugim zagotavljajo slovenske univerze. Kljub izjemno veliki ponudbi štipendij za področje tehnike in naravoslovja v občini Idrija so le-te zaradi premejhnega zanimanja dijakov ostajale nepodeljene.

Sami začetki projekta »Spodbujanje mladih za naravoslovje in tehniko« segajo v januar leta 2005. Tedaj me je podpredsednik koncerna Kolektor seznanil s kadrovsko problematiko podjetja in načrti zaposlovanja v podjetju. Kot učiteljico fizike na idrijski gimnaziji so me povabili k sodelovanju pri pridobivanju kadrov s področja tehnike in naravoslovja. Ker je fizika eden izmed ključnih predmetov za bodoče študente tehnike, sem videla v tovrstnem povabilu izziv, kako približati fiziko in njeno uporabno vrednost mladim. Laboratorijske vaje so eden izmed načinov, da dijaki spoznajo neposredno delovno okolje razvojnega inženirja. S seznanitvijo dijakov z delovnim okoljem in z možnostjo graditve nadaljnje kariere v tujini bi deficitarni poklici postali dijakom zanimivejši, kar bi posledično pomenilo, da bi se dijaki v večjem številu odločali za tovrstne študije.

METODA

Projekt »Spodbujanje mladih za naravoslovje in tehniko« je kot inovacijski projekt tekel 3 leta v sodelovanju z Zavodom za šolstvo. Prvič smo v projekt vključili generacijo gimnazijcev, ki je v šolskem letu 2005/06 obiskovala 1. letnik. Da bi potrdili pravilnost naše odločitve o vključitvi mladih v projekt, smo vseskozi spremljali in preverjali odziv te generacije na sam potek laboratorijskih vaj. Postopoma smo vsako šolsko leto v projekt vključevali nove generacije gimnazijcev. Tako še danes dijaki vsako šolsko leto opravijo po eno izmed obveznih vaj pri pouku fizike v enem izmed laboratorijev korporacij Hidria in Kolektor. Vse vaje dijaki izvedejo v času, namenjenem laboratorijskim vajam. Vajo v prvem in tretjem letniku dijaki izvedejo v dveh šolskih urah (v ta čas je vštet tudi prihod dijakov na podjetje in kratek ogled proizvodnje), kar je mogoče zaradi relativne bližine podjetja Kolektor. V drugem letniku dijaki opravijo laboratorijsko vajo iz fizike na Inštitutu Klima v Godoviču, ki je nekaj kilometrov oddaljen iz Idrije. Izvedbo vaje združimo z ogledom inštituta in proizvodnje IMP Klima Godovič, ki je del korporacije Hidria, zato v Godovič z avtobusom odpeljemo dva razreda hkrati. Zaradi oddaljenosti laboratorija izvedba vaje presega dve šolski uri.

Izbira vaj temelji na učnih vsebinah v posameznih letnikih. Za samo izbiro teme je bil potreben predhodni ogled laboratorijev in prilagajanje meritev in merilnih instrumentov dijakom. Tako v prvem letniku opravijo vajo s področja sil pri kroženju (Podiranje kolektorja), v drugem letniku s področja toplotnega sevanja (Analiza portreta z infrardečo kamero), v tretjem letniku s področja elektrike (izdelava tiskanega vezja, ki mora zadostiti danim pogojem – uporaba Ohmovega zakona). Pred vsakim opravljanjem vaj dijaki dobijo navodila, s pomočjo katerih izvedejo meritev in izdelajo končno poročilo.

REZULTATI

Projekt smo evalvirali le pri prvi generaciji. Svetovalna delavka je anketirala dijake o študijskem interesu za naravoslovje in tehniko ob vpisu v prvi letnik. Hkrati so na vprašalnik odgovarjali dijaki, ki so bili ob vpisu prve generacije dijakov vključeni v projekt v tretjem letniku. Odgovori niso pokazali bistvenih razlik v interesu za študij naravoslovja med tretješolci in prvošolci, kljub temu da so bili tretješolci v času izvedbe ankete že vključeni v informiranje o prednostih zaposlovanja in študija v tehničnih poklicih. Leta 2008 je generacija dijakov, ki so bili prvi vključeni v projekt, zaključevala tretji letnik. V mesecu maju, ko so vsi dijaki opravili v vsakem letniku vsaj po eno vajo v podjetjih, so ponovno odgovarjali na anketni vprašalnik o študijskem interesu. Izpolnili so tudi evalvacijski vprašalnik, s katerim smo preverili vpliv vaj na njihovo morebitno odločitev za naravoslovje in tehniko. Iz primerjave odgovorov na vprašalnike, ki so jih dijaki izpolnjevali v prvem in v tretjem letniku, se je pokazalo, da je interes za naravoslovje in tehniko pri dijakih prve generacije narasel.

Iz evalvacijskih vprašalnikov smo razbrali, da je večini dijakov (60,3% ali 44 vseh anketiranih) tovrstno opravljanje laboratorijskih vaj pomenilo dragoceno izkušnjo. 75,3% ali 55 vseh anketiranih dijakov je odgovorilo, da je tovrstna izkušnja vplivala na njihov interes za tehniko in naravoslovje, pri precejšnjem deležu (50,7% ali 37 vseh anketiranih) pa je interes za naravoslovne in tehnične poklice narasel, pri čemer 86,5% ali 32 vseh anketiranih navaja, da je k temu prispevala tudi izvedba vaj v podjetjih, iz česar lahko sklepamo, da je od 73 anketiranih dijakov vsaj 37 (50,7%) takšnih, ki kažejo interes za tehniko in naravoslovje.

ZAKLJUČEK

Primerjava rezultatov analiz odgovorov na vprašalnike je pokazala, da tovrstno izvajanje vaj v neposrednem okolju podjetij pripomore k lažji odločitvi dijakov za tehnične poklice. Prav tako primerjava med analizo interesov, izvedeno med tretješolci leta 2006 in tretješolci, ki so bili vključeni v projekt leta 2008, kaže porast interesa za tehniko in naravoslovje. Leta 2006 je bilo takšnih 25,3%, leta 2008 pa 50,7%.

Izvajanje laboratorijskih vaj v laboratorijih podjetij je novost, ki pomeni dijakom neprecenljivo izkušnjo. Je nov model opravljanja obveznih vaj na drugačen način in v avtentičnem okolju podjetij. Dijaki se soočajo z dejavnostmi podjetja in spoznavajo uporabnost naravoslovnih ved, hkrati pa spoznajo delo strokovnjakov z deficitarnim poklicem.

Model izvajanja vaj je uporaben v vseh šolah z vzgojno-izobraževalnimi programi s predpisanimi obveznimi laboratorijskimi vajami.

Gimnazija Jurija Vege Idrija vsa leta, od prvih izvedb vaj pa do danes, ohranja tovrsten način sodelovanja z industrijo. Še več, sodelovanje krepi in ga nadgrajuje z dodatnimi aktivnostmi za dijake. Nadarjeni dijaki imajo možnost opravljati počitniško delo v razvojnih laboratorijih in s pomočjo mentorjev iz podjetij izdelati raziskovalne in seminarske naloge.

Dobro sodelovanje med šolo in domačimi podjetji je prineslo večjo vključenost šole v lokalno okolje, hkrati pa se je povečal tudi interes industrije za čim boljše pogoje dela dijakov in učiteljev na šoli .

PROJECT WORK AS A GOOD STRATEGY FOR WORKING WITH GIFTED SCHOLARS IN ENGINEERING AND TECHNOLOGY
/
PROJEKTNA NALOGA KOT DOBRA STRATEGIJA ZA DELO Z NADARJENIMI UČENCI PRI TEHNIKI IN TEHNOLOGIJI

Janez Virtič

OŠ Sava Kladnika Sevnica

janez.virtic@guest.arnes.si

ABSTRACT

Article discusses project work as an integrated strategy with constructivistical view of learning, developing scholars' creativity and other personal potentials. Project work is embedded in the educational work of layout problem, seeking solutions by sketching and modeling, prototyping, technological documentation, organization of production and economics of the product. The present strategy not only stimulates cognitive functioning, but also includes personal aspect of the scholar and encourages motivation and respectful teacher-scholar relation. The process allows scholars to gain additional knowledge and skills in a creative way according to their capabilities. Furthermore, it enables deepening, repetition and use of knowledge in the areas of technology, industrial design, work organization, economics and sustainable living.

Keywords: *Project work, gifted, creativity, capability, sustainable development.*

UVOD

Projektna naloga je tista strategija vzgojno-izobraževalnega dela, kjer gre za razvoj divergentnega mišljenja in ustvarjalnih sposobnosti. S konstruktivističnim pogledom pa je izobraževalna teorija, ki poudarja, da učenje poteka še posebej učinkovito takrat, ko učenci doživljajo izkustvo in tvorijo smiselni produkt. Znanje usvajajo tako, da so v obliki vloge dejavno vključeni v učni proces in na ta način gradijo oziroma konstruirajo znanja na osnovi izkušnje. Najpomembnejše je vodilo, da otrok konstruira svoje znanje sam, z lastnimi izkušnjami, pri čemer igra pomembno vlogo okolje (šolsko in življenjsko) in moč doživljanja v procesu pridobivanja znanja (Krapše, 1999). “Nadarjenost je sestavljena iz interakcije med tremi osnovnimi grozdi človeških potez: nadpovprečne splošne intelektualne sposobnosti, visoke stopnje zavzetosti za izpolnjevanje nalog (motivacija) in visoke stopnje ustvarjalnosti” (Ferbežer, 2002: 35). Postavlja se vprašanje, kako organizirati učno-vzgojni proces, da pride do interakcije vseh potez. Le tenkočutnost vzgojno-izobraževalnega sistema in procesov do mladega človeka bo prinesla pričakovane vzgojno-izobraževalne rezultate.

METODA

Simbioza in senzibilnost projektne naloge v učnem procesu s svojimi dejavnostmi in taksonomsko fleksibilnostjo na vseh zahtevnostnih ravneh, omogoča vsem udeležencem enakopravno udeležbo in po zmožnostih prilagojeno dejavnost, ter učno-vzgojni napredek posameznika.

Projektna naloga

Projektna naloga kot učna strategija ima razvojne stopnje razčlenjene po korakih in se med avtorji nekoliko razlikujejo po razporeditvi, interpretaciji in poimenovanju korakov.

Moja dolgoletna izkušnja potrjuje, da je zelo primerna naslednja razčlenitev:

- **Načrtovanje projektne naloge, skiciranje in izbor idejne rešitve;** Iskanje učenčevih močnih interesnih področij, omejitev problema, postavitev kriterijev za razvijanje in skiciranje ideje, skiciranje in modeliranje ideje (lahko računalniško), Izbor najboljše rešitve po kriterijih.
- **Izdelava prototipa;** Izbor gradiv (labolatorijsko preizkušanje gradiv), izbor orodij in strojev, izdelava prototipa, preizkušanje prototipa, korekture in dopolnitve prototipa.
- **Izdelava tehnične in tehnološke dokumentacije;** Dopolnitev znanj tehničnega risanja, delavniška, montažna risba s kosovnico, tehnološki list.
- **Organizacija in stabilizacija delovnega mesta, ekologija;** Razdelitev delovnih mest po interesih, Racionalizacija delovnih postopkov (izdelava šablon), ergonomsko in varno delovno mesto, skrb za okolje (odpadki, energija).
- **Izvedba proizvodnje;** Proizvodnja sestavnih delov na zalogo, montaža sestavnih delov v celoto.
- **Ekskurzija v proizvodni obrat;** Načrtovanje ogleda v obrat proizvodnje, ogled in reševanje delovnih listov, analiza ogleda.

Analiza in ekonomika projekta, vrednotenje; Analiza vlog posameznikov v procesu projektne naloge, pomen skrbno načrtovane proizvodnje, vplivi na ceno izdelka, izračun cene izdelka (program kalkulacije), poklicne potrebe

ANALIZA IN REZULTATI

Konstruktivistično naravnano usmerjanje učenja omogoča manjšo in počasnejšo »kopnenje« znanja, kar je moč sklepati, če nekaj skonstruiraš sam oziroma se do nečesa sam dokoplješ na svoj način, ima le-to daljšo in močnejšo obstojnost. Hkrati pa je to močan dejavnik, ki razvija notranjo motivacijo za nadaljnje učenje in ne nazadnje prispeva tudi k pozitivnemu čustvenemu vrednotenju (sebe, krepitvi samopodobe, znanja in tudi učitelja kot usmerjevalca.

ZAKLJUČEK

Ustvarimo pogoje, da bo upoštevano spoznanje konstruktivistov, ki pravi, da znanja v gotovi obliki ne moreš drugemu “dati” niti od nekoga “sprejeti”, ampak ga mora vsakdo z lastno miselno aktivnostjo ponovno zgraditi in pri tem ima projektna naloga odločilno vlogo in pomen. To pa naj pomeni izziv in možnost za odkrivanje in razvijanje nadarjenih otrok (Amand Papotnik, 2003). Družba brez praktične ustvarjalnosti in iskanja novih rešitev v proizvodnji, ekonomiki, trgu blaga in dela, bo težko preživela ali se izvila iz gospodarske krize. Naložba znanj v mladega človeka je dolgoročna razvojna strategija družbenega razvoja.

ABSTRACT

Previous research has proven that academic achievements are positively correlated with autonomous motivation. Students from 10 Slovenian *grammar schools* were involved in empirical study, in which a cluster analysis revealed two motivational profiles: a low quantity motivation group (low controlled and autonomous motivation) and a good quality motivation group (high autonomous and low or average controlled motivation). Statistically significant differences between the two identified motivational profiles were found for students' general as well as chemistry performance in three grades of schooling. Furthermore, a good quality motivation group is also more in favour of autonomy-supportive teaching methods used in chemistry classes.

Keywords: *students' motivational profiles, academic achievements*

UVOD

Raziskave na področju teorije učenja, ki so v zadnjih desetletjih omogočile vpogled v proces učenja, so v šolsko prakso uvedle vrsto novih strategij učenja in poučevanja (Dreyfus, Jungwirth, in Eliovitch, 1990; Niaz, 1995; Posner, Strike, Hewson, in Gertzog, 1982; Dykstra, Boyle, in Monarch, 1992). Tradicionalen način poučevanja, ki temelji predvsem na predavanjih, pri katerih so učenci in dijaki zgolj pasivni prejemniki informacij in podatkov, so začele nadomeščati bolj aktivne oblike poučevanja in učenja, ki jih v zadnjem času, tudi pri nas, vgrajujemo v učne načrte predmetov kot didaktična priporočila in uvajamo v v šolsko prakso. Razumevanje procesa učenja je omogočilo razvoj modelov učenja in poučevanja, pri katerih učenci in dijaki samostojno, preko različnih aktivnosti, razvijajo svoje lastne teoretične okvire stroke in si bolj ali manj samostojno gradijo bazo znanja. Vloga učitelja v tem procesu je predvsem usmerjevalna. Učitelj dopolnjuje nepopolne ali celo napačne predstave in usmerja ter spodbuja razmišljanje. Na področju naravoslovnega izobraževanja se je uveljavil zlasti izkustveni pristop, ki temelji na samostojnem odkrivanju novega znanja na osnovi načrtovanja in izvajanja eksperimentov, ali iskanju podatkov in informacij v ustreznih informacijskih virih, njihovi analizi, sintezi ter povezovanju s teorijo. Vendar so rezultati raziskav o učinkvitosti novih učnih strategij pri naravoslovnih predmetih, v primerjavi s tradicionalnimi, često nasprotujoči. Tako nekatere raziskave dokazujejo, da so novi pristopi brez pravega učinka na kvaliteto znanja (Pine in sodelavci, 2006), druge (McCarthy, 2005; O'Neill, 2004) pa kažejo na večjo učinkovitost aktivnih pristopov učenja in poučevanja v primerjavi s tradicionalnimi pristopi. Novejše študije učne motivacije odkrivajo vzroke za takšno stanje, saj so učni oz. študijski uspehi vedno v pozitivni korelaciji z motivacijskimi profili učeče se populacije in posredno, z motivacijskim profilom učitelja (Fortier, Vallerand, in Guay, 1995; Grolnik, Ryan, in Deci, 1991; Guay, in Vallerand, 1997; Ratelle, Guay, Vallerand, Larose, in Senécal, 2007). Motivacija za učenje je visoko kvalitetna, če temelji na avtonomni motivaciji, ki jo nadzirajo intrinzični, identificirani in integrirani motivacijski regulatorji oz. je nizke kvalitete, če temelji na kontrolirani motivaciji, ki jo nadzirajo zunanji in introjecirani regulatorji (Guay, Ratelle, in Chanal, 2008). Raziskave na področju motivacije so tudi dokazale, da so učenci in dijaki znatno bolj avtonomno motivirani, če učitelj uporablja avtonomen stil poučevanja, ki zagotavlja sproščeno, vendar delovno učno okolje (Chirkov, in Ryan, 2001; Vansteenkiste, Simons, Lens, Sheldon, in Deci, 2004). V pričujoči raziskavi smo preučevali motivacijske profile naših gimnazijcev in povezanost motivacijskega profila s splošnim uspehom in uspehom pri kemiji ter odnosom do učnih pristopov pri pouku kemije.

METODA

Za ugotavljanje motivacijskih profilov smo modificirali poseben motivacijski vprašalnik (Black in Deci, 2000; Juriševič, Razdevšek Pučko, Devetak, in Glažar, 2008) z 31 trditvami, do katerih so morali testiranci izraziti raven strinjanja z uporabo Likertove lestvice od 1 do 5 (1 = zame ta trditev ne velja; 5 = zame ta trditev povsem velja). Trditve so ustrezale posameznim motivacijskim regulatorjem za prepoznavanje avtonomne in kontrolirane motivacije ter samopodobe. Pri opredeljavanju motivacijskih profilov je bila uporabljena klasifikacija, ki so jo predlagali Vansteenkiste s sodelavci (2009). V raziskavi je sodelovalo 361 gimnazijcev in gimnazijk iz 10 gimnazij. Povprečna starost testirancev je bila 16,4 leta. Testiranje smo izvedli v maju in juniju leta 2009. Za klasifikacijo smo uporabili metodo K-tega najbližjega soseda, za ugotovaljanje statistične pomembnosti razlik med skupinama pa t-test.

REZULTATI

Klasifikacija dijakov glede na vrednosti kontrolirane in avtonomne motivacije (notranje in regulirane) ter samopodobe z metodo K-tega najbližjega soseda pokaže, da lahko dijake glede na izbrane klasifikacijske kriterije razdelimo v dva klastra oz. skupini. Za dijake, ki pripadajo I. skupini, je značilna podpovprečna avtonomna (notranja 2 in regulirana 2) motivacija in podpovprečna kontrolirana motivacija (2), Tabela 1. Ti dijaki se uvrščajo v motivacijsko skupino *nizke kvantitete*. Dijaki II. skupine sodijo v skupino *dobre kvalitete* (povprečna kontrolirana motivacija (3) in nadpovprečna avtonomna motivacija (notranja 4 in regulirana 4)). Vpliv motivacijskega profila na splošni učni uspeh in na uspeh pri kemiji je prikazan v Tabeli 2 in statistična pomembnost razlik v Tabeli 3.

Tabela 1: Rezultat klasifikacije

Začetni centri klastrov			Končni centri klastrov			Število primerov klastrih		
	Klaster			Klaster		Klaster	1	171
	I	II	Notranja motivacija	I	II		2	189
Notranja motivacija	1	5	Samopodoba	2	4	Veljavni		360
Samopodoba	1	5	Kontrolirana motivacija	2	3	Manjkajoči		1
Kontrolirana motivacija	2	3	Regulirana motivacija	2	3			
Regulirana motivacija	1	5	Notranja motivacija	2	4			

Tabela 2: Odvisnost predhodnega šolskega uspeha od motivacijskega profila

Uspeh	*Skupina*	N	Srednja vrednost	Std. deviacija	Std. napaka
Splošni uspeh 1.razred	I	166	3.49	.807	.063
	II	182	4.03	.814	.060
Splošni uspeh 2. razred	I	114	3.33	.816	.076
	II	117	4.07	.817	.076
Splošni uspeh 3. razred	I	36	3.64	.867	.144
	II	40	4.50	.641	.101
Kemija 1. razred	I	166	3.19	.959	.074
	II	182	4.01	.934	.069
Kemija 2. razred	I	114	2.88	.923	.086
	II	117	3.96	1.003	.093
Kemija 3. razred	I	37	3.27	.871	.143
	II	40	4.45	.677	.107

Tabela 3: T-test enakosti srednjih vrednosti

						95 % interval zaupanja	
	t	df	Sig. (2-tailed)	Srednja vrednost razlik	Std. napaka razlike	Nižja	Višja
Kem 1. r.	-8.057	346	.000	-.818	.102	-1.018	-.618
Kem 2. r.	-8.508	229	.000	-1.080	.127	-1.330	-.830
Kem 3. r.	-6.663	75	.000	-1.180	.177	-1.532	-.827
Sp. us. 1. r.	-6.196	343	.000	-.539	.087	-.710	-.368
Sp.us. 2. r.	-6.838	229	.000	-.735	.107	-.947	-.523
Sp. us. 3. r.	-4.957	74	.000	-.861	.174	-1.207	-.515

Na ravni signifikantnosti 0,01 so bile s t-testom dokazane statistično pomembne razlike med splošnim uspehom in uspehom pri kemiji med pripadniki motivacijske skupine *nizke kvantitete* (skupina I.) in motivacijske skupine *dobre kvalitete* (skupina II.) Testiranci, ki so uvrščeni v motivacijsko skupino *dobre kvalitete* (II. skupina) imajo statistično pomembno bojši splošni učni uspeh in oceno iz kemije v vseh treh razredih gimnazije. Motivacijski profil dijakov se je odrazil tudi v njihovem odnosu do različnih strategij poučevanja kemije. Tako so za motivacijsko skupino dobre kvalitete povprečne ocene, ki so jih dijaki dali posameznim učnim pristopom, statistično pomembno višje na ravni signifikantnosti 0,01 za odnos do predavanj in izkustvenega pristopa in na ravni signifikantnosti 0,05 tudi za samostojno delo z učbenikom. Dijaki, ki se uvrščajo v motivacijsko skupino, za katero je značilna nadpovprečno visoka avtonomna motivacija, kažejo bolj pozitivni odnos do avtonomnega stila poučevanja, hkrati pa tudi bolje cenijo dobro učiteljevo razlago v primerjavi z dijaki, ki pripadajo motivacijski skupni nizke kvantitete.

Rezultati o priljubljenih in nepriljubljenih kemijskih vsebinah in vzrokhih za interes so odkrili, da sta glavna vzroka za nepriljubljenost nekateih kemijskih vsebin poleg splošne odsotnosti interesa, nerazumljiva učiteljeva razlaga in nepovezanost izbranih vsebin z življenjem. Kar preseneča je dejstvo, da so dijaki med z življenjem nepovezane vsebine uvrstili vrsto vsebin iz organske kemije (npr. ogljikove hidrate, proteine, nafto), elektrokemijo, vključno z galvanskimi členi in elektrolizo ter entalpijo. Lahko trdimo, da se v odklonilnem odnosu dijakov odraža učiteljev pristop. Po ugotovitvah Black-a in Deci-a (2000) ter Reeve-a (2009) je učiteljeva odgovornost, da poveže vsebine z izkustvi učencev oz. dijakov in da izbere takšno učno strategijo, ki bo zagotavljala dobre učne rezultate. Nerazumljiva učiteljeva razlaga, brez uporabe sodobnih vizualizacijsih sredstev (eksperiment, IKT) je že sama po sebi dovolj tehten razlog, ki odvrne dijake od določene vsebine in znižuje že tako nizko avtonomno motivacijo

ZAKLJUČEK

V raziskavi sta bila identificirana dva motivacijska profila dijakov; motivacijski profil *nizke kvantitete* in *dobre kvalitete.* Raziskava je potrdila rezultate predhodnih, da imajo najboljše učne uspehe tisti dijaki, ki se uvrščajo v motivacijsko skupino *dobre kvalitete*, tem dijakom tudi najbolj ustreza avtonomni stil poučevanja, ki se je odrazil na njihovem bolj pozitivnem odnosu do avtonomnega stila poučevanja.

FEELING GREAT IN YOUR OWN SKIN
/
DOBRO POČUTJE V LASTNI KOŽI

Petra Vrtačnik Žveplan

OŠ Tončke Čeč Trbovlje

petra@softdata.si

ABSTRACT

The title of the topic is »Feeling great in your own skin«. Students make different cosmetics such as: relaxing massage oil, scented bath salt, cucumber tonic, hand cream, lip balsam, calendula cream, liquid soap, herbal soap, scented liquids, air freshener. Before starting all the students get detailed instructions for work and a work sheet. The students learn to use various laboratory techniques, they learn to measure, weigh, how to use the burner, they also familiarise themselves with the healing properties of plants and most importantly, how to apply these skills in everyday life.

Keywords: *Cosmetics workshop.*

UVOD

Glede na to, da je velik poudarek pri naravoslovju na diferenciaciji pouka in na drugačnih metodah dela, sem se odločila, da kot prispevek pošljem primer dobre prakse, ki ga izvajam že četrto leto, seveda z vsakoletnimi izboljšavami in dopolnitvami. Zadeva je uporabna za izbirni predmet, za delo z nadarjenimi učenci, za naravoslovni dan, za dodatni pouk, za naravoslovni krožek, za prednovoletne delavnice, konec koncev pa tudi za popestritev rednega pouka. Različni poskusi so namenjeni učencem v tretji triadi, nekateri poskusi pa so primerni tudi za učence druge triade, ali pa za učence prilagojenega izobraževalnega programa z nižjim izobrazbenim standardom.

METODA

Metoda dela je eksperiment. Moje mnenje je, da učenci pridejo do kakovostnejšega in trajnega znanja le s pomočjo raziskovanja, reševanja problemov in izvajanja poskusov. Učenci delajo v skupinah, na koncu vsak učenec preizkusi svoj kozmetični pripravek. Naslov kozmetične delavnice je : »Dobro počutje v lastni koži«. Učenci izdelujejo različne kozmetične pripravke, kot so:

- sproščujoče masažno olje,
- dišeča kopalna sol,
- kumarični tonik,
- krema za roke,
- balzam za ustnice,
- ognjičeva krema,

- tekoče milo,
- zeliščno milo,
- dišavna tekočina,
- osvežilec zraka.

REZULTATI

Glede na to, da so rezultati večletnega dela pokazali izredne uspehe, sem se odločila, da to predstavim tudi drugim kolegom. Najpomembnejše je dejstvo, da učenci spoznajo uporabnost kemije v vsakdanjem življenju.

Poskusi so preprosti, povsod je na prvem mestu varnost in zaščita. Pred začetkom dobijo učenci natančna navodila za delo in delovni list. Skoraj vsi poskusi so namenjeni za eno šolsko uro, razen izdelave kumaričnega tonika. Učenci se naučijo uporabljati različne laboratorijske tehnike, naučijo se natančnega merjenja in tehtanja, urijo se v uporabi gorilnika, spoznajo različno uporabnost zdravilnih rastlin, kar pa je najpomembnejše, znajo uporabiti znanje naravoslovja v vsakdanjem življenju.

Pri delu vedno vsi uživamo, učenci so navdušeni in zadovoljni. S preprostimi poskusi nam uspe izdelati različne kozmetične pripravke, ki nam izboljšajo počutje ali polepšajo dan.

ZAKLJUČEK

V prilogi so vse recepture oziroma postopki izdelave posameznih kozmetičnih pripravkov, učno delovni listi in seveda navodila za delo. Včasih je problem embalaža, sami največkrat uporabimo embalaže oziroma lončke kupljenih, že porabljenih krem, včasih pa lončke nabavimo v lekarni ali v steklarniški trgovini. Pri ustvarjanju vam želim veliko uspeha.

THE CANYON OF KOKRA: FROM IDEA TO PRODUCT / KANJON KOKRE: OD IDEJE DO IZDELKA

Bojana Zavolovšek

ESIC Kranj

bojana.zavolovsek@guest.arnes.si

ABSTRACT

In the programme civil engineering technician, a lot of time is spent getting to know the local landscape. As there is in the nearby vicinity of the school virtually an outdoor classroom – the canyon of the Kokra river. As students also learn to produce a model at professional civil engineering subjects, we decided to produce a model of the Kokra canyon, We made a plan how to produce a model. And it is exactly the project work the very thing where students can consolidate theoretical knowledge from multiple subjects, due to which student's knowledge becomes more durable and more useful.

Keywords: C*reative work, Kokra canyon, local landscape.*

UVOD

Cilj projekta je bila izdelava makete kanjona reke Kokre. Projekt sem izvedla z dijaki Srednje gradbene šole, smer gradbeni tehnik, pri urah geografije, delno v prisotnosti učiteljice umetnosti pri urah umetnosti in pri v prisotnosti učitelja pri predmetu osnove projektiranja.

Dijaki se pri različnih strokovnih predmetih učijo praktične uporabe pridobljenega znanja. Že med samim izobraževanjem morajo v okviru delovne prakse praktično predstaviti različne projekte in naloge. Zato sem se odločila, da tudi v okviru predmeta geografija predstavim nekaj praktičnega dela, katerega ideje bodo lahko uporabili pri predstavitvah.

Zakaj sem izbrala prav kanjon reke Kokre? Pri pouku geografije veliko časa namenimo spoznavanju domače pokrajine. Ker imamo v neposredni bližini šole tako rekoč učilnico na prostem – kanjon reke Kokre, sem se odločila tej pokrajini nameniti nekoliko več časa in jo temeljito raziskati, opisati in predstaviti tudi nekoliko drugače. Želela sem, da teoretično znanje postane trajnejše in bolj uporabno.

Cilji našega projekta so bili naslednji:

- razvijamo sposobnost dijakov za uporabo preprostih raziskovalnih metod, s katerimi pridobivajo in posredujejo znanje o pokrajini
- razvijamo zanimanje dijakov za domačo pokrajino
- pridobivajo in razvijajo sposobnost za opazovanje naravnih in družbenih pojavov in procesov v pokrajini
- naučijo se izdelati nekatere vrste zemljevidov in se znajo orientirati na različnih zemljevidih in v naravi

- probleme preučijo sami ali v skupini, pri čemer upoštevajo načela individualiziranega ali timskega dela, motivacije in kreativnosti
- aktivno sodelovanje dijakov v vseh fazah didaktičnega projekta
- razvijajo ročne spretnosti
- razvijamo občutek estetike
- zadovoljstvo in sprostitev med delom
- navadijo se pripraviti in pospraviti delovni prostor

METODA

Projekt smo začeli s pogovorom o domači pokrajini. Obnovili smo znanje o tipih površja, delovanju reke in rečnih dolinah. Ogledali smo si kanjon reke Kokre in ga fotografirali. Dijaki so dobili v razmislek, kako bi s pomočjo znanja strokovnih predmetov izdelali maketo kanjona. Predstavili so veliko zanimivih idej, večina pa se jih je nanašala na uporabo gline in stiropora. Tako je postalo glavno vodilo našega projekta: Kako s pomočjo znanja geografije, osnov projektiranja in umetnosti izdelati maketo kanjona reke Kokre.

Po teoretičnem delu je sledil praktični del – izdelava makete.

Z dijaki in profesorjema predmetov osnove stavbarstva in umetnosti smo se dogovorili o nabavi ustreznih materialov. Dijaki so s pomočjo interneta poiskali najugodnejšo ponudbo materiala v trgovini.

Pri uri predmeta osnove projektiranja naj bi dijaki s pomočjo računalnika iz topografskega načrta v merilu izrisali plastnice izbranega dela kanjona in jih preslikali na papir. Pri urah geografije bi iz stiropora izrezali plastnice ter jih »sestavili« v pravo obliko izbranega dela kanjona. Pri urah umetnosti pa izdelali še drevesa in hiše ter jih umestili v maketo.

Maketo bi razstavili na šoli, predstavili bi jo tudi staršem in bodočim dijakom na informativnem dnevu.

REZULTATI

Skupaj z dijaki smo izdelali MAKRO in MIKRO PLAN realizacije zastavljenih ciljev.

➢ MAKRO PLAN:

- KAJ VEMO?
- maketo bomo izdelali sami
- maketo bomo razstavili v vitrini na šoli
- KAJ SE ŽELIMO NAUČITI?
- kako izdelali maketo
- spoznati uporabnost stiroporja, gline ter drugih materialov in orodij
- slediti fazam ustvarjanja
- znati posredovati izkušnje in znanje
- KAJ BOMO NAREDILI?
- izdelali bomo maketo kanjona Kokre v merilu 1:200

- izdelek bomo razstavili
- naše delo bomo dokumentirali s fotografijami

Nato smo natančneje določili, KAJ bomo delali, KAKO in KDAJ bo potekalo delo pri posameznih predmetih in KAKŠNE zadolžitve bodo imeli dijaki.

➢ MIKRO PLAN:

- GEOGRAFIJA:

- uvodna motivacija: domača pokrajina, kanjon Kokre, rečna erozija, zemljevidi in njihova izdelava, ogled in fotografiranje terena, določitev obsega in merila predstavitve kanjona,
- planiranje dela: katere materiale in orodja bomo potrebovali, kje jih bomo najceneje kupili
- delo v učilnici: izrezovanje plastnic iz papirja in izrezovanje plastnic iz stiroporja
- sestavljanje plastnic, lepljenje
- izrezovanje in lepljenje reke Kokre
- postavljanje dreves, hiš, cest na maketo
- izdelava mostov

- OSNOVE STAVBARSTVA:

- izdelava plastnic s pomočjo računalniškega programa, vsak dijak izriše svojo plastnico
- tiskanje plastnic na papir
- načrt za izdelavo hiš, cest, reke, mostov
- idejna zasnova makete

- LIKOVNA UMETNOST:

- izdelava dreves iz gline, barvanje dreves
- izdelava hiš iz stiroporja, lepljenje streh.

Po teoretičnem delu je sledil praktični del – izvedba makete.

Dijaki so k pouku prinesli ustrezen material in orodja, nekaj materiala smo dobili v šoli.

Že prej smo se dogovorili, da bo večina dijakov delala maketo iz stiroporja pri urah geografije. V ta namen smo dobili tudi poseben prostor, da nam ni bilo potrebno prenašati materiala. Maketo so izdelovali v skupinah, vsak dijak je dobil svojo zadolžitev: eni so izrezovali plastnice, drugi so iz stiroporja izrezovali plastnice, tretji so jih lepili na podlago (iveral 1m x 2m).

Pri uri umetnosti so iz gline v merilu izdelali drevesa in jih pobarvali. V merilu in po načrtu so izrezali hiše, strehe pa sestavili iz smirkovega papirja v barvah strešnikov

Slika 1: Maketa kanjona Kokre

ZAKLJUČEK

Vaja je zanimiva, saj jo izdelamo v zelo kratkem času na dokaj enostaven način. Materiali za delo so dostopni in poceni, navodila za delo preprosta in razumljiva. Za dijakovo izdelavo je zelo enostavna. Največja pazljivost je potrebna pri izrezovanju plastnic in njihovemu sestavljanju.

Z izdelavo profila kanjona Kokre so bili dijaki na nevsiljiv način primorani uporabiti znanja več predmetov in jih prikazati kot konkretni izdelek. Nad projektnim učnim delom so bili navdušeni, saj so bili vključeni v vse faze, v katerih so lahko ustvarjali, tudi po lastnih zamislih. Na končni izdelek so zelo ponosni, saj danes stoji v avli šole.

PEER INSTRUCTION IN INTRODUCTORY PHYSICS COURSE IN SLOVENIAN SECUNDARY SCHOOL / KOLEGIALNO UČENJE PRI UVODNIH POGLAVJIH FIZIKE V GIMNAZIJI

Marko Žigart

Srednja šola Slovenska Bistrica

marko.zigart@guest.arnes.si

ABSTRACT

The purpose of this article is to present the method of teaching called Peer Instruction on Linear Kinematics used with first-year students in Slovenian secundary school. The traditionally taught control group was used to measure effectiveness of the tested method. We compare performances on conceptual and on standard problems.

Keywords: *Physics Education, Peer Instruction, Elementary Kinematics.*

UVOD

Predstaviti želimo aktivno obliko pouka v 1. letniku gimnazije na primeru premega gibanja. Preverjali smo metodo kolegialnega učenja (*Peer Instruction*), ki jo je v devetdesetih letih prejšnjega stoletja pričel razvijati Eric Mazur s Harvarda. V kasnejših primerih uporabe na različnih ustanovah se je izkazala kot zelo učinkovita aktivna metoda učenja tako v manjših kot večjih heterogenih skupinah.

Kolegialno učenje poteka po točno določenih korakih. Po uvodni predstavitvi snovi sledi učenje ob uporabi kratkih konceptualnih vprašanj izbirnega tipa, ki so pripravljena tako, da razkrivajo in odpravljajo zmotna mišljenja dijakov in dijakinj o pojavih in naravnih zakonitostih ter jih vzpodbujajo k aktivnemu učenju. Vlogo vprašanja lahko nadomesti interaktivni demonstracijski poskus, pri katerem dijaki in dijakinje vnaprej napovejo njegov izid. Vprašanju ali poskusu sledi krajši čas za razmislek. Nato dijaki in dijakinje glasujejo za pravilni odgovor. Po odgovoru v parih ali manjših skupinah razpravljajo o vprašanju in izmenjajo argumente za svoje odločitve. Proces razprave med vrstniki je osrednji del metode kolegialnega učenja, ker zahteva aktivno debato, ki lahko potrdi ali ovrže prvotno sklepanje. Sledi ponovno odgovarjanje na vprašanje, ki praviloma izboljša statistiko pravilnih odgovorov. Šele po drugem glasovanju se poda in pojasni rešitev. Tehnike glasovanja so lahko različne: od dvigovanja tablic do uporabe elektronskih volilnih sistemov, vendar raziskave kažejo, da izbira tehnike ne vpliva neposredno na učinkovitost metode.

Ker je bila metoda prvenstveno razvita in preizkušena v univerzitetnem okolju, na dodiplomskem študiju, nas je zanimalo, kako je z njeno prenosljivostjo v srednjo šolo. Ugotavljali smo tudi, kako učinkuje na pouk prenos iz drugega kulturnega okolja v slovenski prostor.

Prispevek je del magistrske naloge, ki nastaja pod mentorstvom izr. prof. dr. Aleksandra Zidanška.

METODA

V raziskavo smo vključili po sposobnostih in predznanju primerljiva prva letnika, tako da je bil eden izmed njiju kontrolni razred s tradicionalnim poukom. Pred izvedbo raziskave so dijaki in dijakinje reševali diagnostični predtest, s katerim smo ugotavljali njihove sposobnosti konceptualnega razmišljanja in njihovo predznanje. Po končanem obdobju testiranja 7 šolskih ur smo diagnostični test ponovili in rezultate primerjali s predtestom. Ob vseh pozitivnih učinkih metode smo želeli še pokazati, da ima metoda primerljiv pozitiven učinek na dijake in dijakinje z različnimi sposobnostmi in različnim predznanjem.

REZULTATI

V rezultate testiranja smo vključili tiste dijake in dijakinje, ki so reševali pred- in končnitest. V testiranem razredu (TR) je bilo 31, v kontrolnem (KR) pa 26 dijakov in dijakinj. Predtest je pokazal rahlo razliko v predznanju in sposobnostih obeh skupin: TR je dosegel 31,5 %, KR pa 36,5 % rezultat. Pri končnem testu, ki se je v nekaterih vprašanjih razlikoval od predtesta, se je pokazala bistvena razlika v napredovanju, saj je TR dosegel 41,7 %, KR pa 32,5 % rezultat.

Napredek posamezne skupine smo natančneje izmerili tako, da smo izračunali normalizirani napredek:

$$g = \frac{\left(S_{po} - S_{pred}\right)}{\left(1 - S_{pred}\right)},$$

pri čemer predstavlja S_{po} rezultat končnega testa in S_{pred} rezultat predtesta. V skupini TR je bil g = 0,15, v KR pa je bil g = –0,06, kar kaže, da kontrolna skupina v obdobju testiranja ni pokazala napredovanja v razvoju konceptualnega razmišljanja.

V končni test smo dodatno vključili dva problema, ki bi jih naj dijaki in dijakinje reševali s tradicionalnim premetavanjem enačb. Obe skupini sta ta del rešili manj uspešno, zato zaključka o vplivu metode na tak način reševanja problemov nismo uspeli izpeljati.

ZAKLJUČEK

Metoda testiranja, imenovana kolegialno učenje, je pokazala, da lahko pričakujemo že v krajšem časovnem obdobju napredovanje v konceptualnem razmišljanju dijakov in dijakinj. Čeprav je bila kontrolna skupina po predznanju in sposobnostih boljša od testirane skupine, je slednja ob zaključku testiranja pokazala na pomembno razliko v napredovanju glede na kontrolno skupino. Kvalitativni rezultati, ki so težje merljivi in se predvsem upirajo na občutenja vseh vključenih v proces poučevanja, pokažejo, da je ob primerni pripravi motivacijskega terena in ob pozitivni učiteljevi spodbudi mogoče doseči, da se dijakinje in dijaki na uro predhodno pripravijo, kar pozitivno vpliva na dinamiko v razredu.
